- (3) **Developing identities:** participation is a key component in third space partnerships. In weaving the community together through collaborative practice and the continuous negotiation of meaning, PSTs gradually move beyond the periphery toward the core of practice (Lave and Wenger, 1991). By crossing the blurred boundaries and performing hybrid roles in practice, the PSTs in this study suggest that they developed their identity as learners, teachers, and colleagues, negotiating meaning. When performing hybrid roles, participants (as well as other members of the teaching community) negotiate their identities by doing, discussing, feeling, belonging, and working together (Wenger, 1998), increasingly becoming more knowledgeable teachers and community members. The back and forth exchange of expertise in third space partnerships bound the community members together and promote hybrid roles that ultimately shapes their identities.
- (4) **Navigating challenges:** even if third space partnerships appear promising, their establishment and sustainability face numerous challenges. The challenges explored in this study suggest that, despite efforts from the partnerships, connections are not robust enough to foster epistemic negotiations, cultivate relations, and develop identities for all PSTs on an equal basis. While some PSTs' experiences were positive and fruitful, others found practice frustrating. These challenges are closely related to the absence or poor execution of the three themes presented above. Hence, a possible way to navigate such challenges would be to strengthen the third space partnerships by enhancing open communication and creating opportunities for negotiation and development.

Third space partnerships are blended Communities of Practice that bolster members' agency to work together in the process of “becoming” and navigating the impending challenges associated with this collaboration. It involves action and connection (Wenger, 1998). While developing their professional identity, PSTs integrate their practice experiences into their professional repertoire by participating, negotiating, and exchanging expertise with other community members. PSTs become increasingly knowledgeable on the institutional regulations and formal requirements of the teaching profession while developing a broader sense of the epistemologies of their school subjects, the pedagogy, and didactics. PSTs also develop relations that promote negotiations and involve producing, redirecting, and extending meaning. Seen as a community of practice, the third space supports an integrated way to connect minds and bodies, including emotions and social connections, while bolstering PSTs' professional development.

As increased coherence and collaboration in partnerships are central elements in research and policy (Hermansen, 2020; Farrell, 2021; OECD, 2015), more significant efforts are needed to improve these alliances to support PSTs' professional development. Consequently, this study has attempted to understand partnerships from within, listening to PSTs' voices and experiences regarding their roles, expectations, participation, and negotiations. Such explorations may shed further light on how third space partnerships collaborate and the crucial factors that determine successful collaboration.

Conclusion

In summation, this third space take on PSTs' practice reveals the continuous challenges and opportunities involved in becoming teachers in more democratic environments. In providing empirical evidence of how PSTs experience practice, we hope to have contributed to clarifying the complex dynamics of third space partnerships and identifying the key ingredients to its development and sustainability. The study supports earlier claims that the third space in TE can bolster connections between schools and TE

institutions and enhance collaboration (Jackson and Burch, 2019; Chan, 2020; Lee, 2018) while also suggesting that PSTs' practice experience requires sound opportunities for epistemic negotiation, active participation, and collaboration that foster their identities and professional development.

Acknowledgment

I would like to thank the pre-service teachers for participating in the study. I also wish to thank Professors Greta B. Gudmundsdottir and Andreas Lund and the other members of the TEPEC research group and the University of Oslo for commenting on an earlier version of this study.

Case methods in teacher education refers to the use of case studies as narratives drawn from real-life instances and used as teaching tools to catalyze group discussion and individual reflection. Using case discussion, case writing, and case analysis is a pedagogical approach that aims to bring real-world events and experience vicariously into the formal teaching and learning spaces of teacher education. Case methods as pedagogy is distinct from case study as a research activity, while both are grounded in epistemologies of narrative and bounded stories.

In this article, we aim to do three things in order to review the topic of case methods in teacher education. First, we will review the prior encyclopedia article (Sato and Rogers, 2010) to provide the grounding that is already in place with regard to case methods. Second, we will provide a brief review of the literature from 2010 to 20 to bring us up to date on the current status of research in this area. Finally, we will propose a way forward for research and practice in case methods as we look to the future and what it might hold for using narrative as a form of holding and sharing knowledge for teaching.

Case methods in teacher education

In the 2010 volume of this Encyclopedia, Carrie Rogers and I summarized case methods in teacher education (Sato and Rogers, 2010). We began by pointing out that case methods have been used in teacher education since the 1980s and developed a substantial research and practice base as a pedagogy throughout the 1990s as it emerged as a promising pedagogy for teacher education (Grossman, 2005; Lundeberg et al., 1999; Merseeth, 1996). Indeed, *Teacher Education Quarterly* dedicated an entire volume to Case Methodology in the Study and Practice of Teacher Education in 1990 (Doyle, 1990).

In that 2010 article, we presented several frameworks for how case methods in teacher education have been framed through a variety of empirical studies with regard to what teachers learn through case-writing and through case analysis. For example, Merseeth (1996) suggested three purposes for the use of case methods: as exemplars or models of best practices; as opportunities for analysis of a complex situation and to practice decision-making; and to stimulate reflection. Adding to the call for research on case study methods, Lundeberg et al. (1999) suggested that the field needed to better understand *what* pre-service teachers actually learn from case methods and *how* that learning occurs. These authors suggested that teachers can learn reasoning ability, problem-framing skills, reflective mindsets, subject-matter knowledge, and pedagogical repertoires through the use of case methods, but these skills, knowledge, and mindsets had not yet been particularly well-defined by the field of teacher education. We also reported that several types of cases have been used within case pedagogy, including exemplars of practice, dilemmas of practice, historical issues, and representations of everyday practice; as well as several structures for presenting cases including written forms, anecdotes, and multimedia representations drawing on student work samples, classroom video, teacher narratives, and reflections.

In the 2010 Encyclopedia article (Sato and Rogers, 2010), we also presented a novel unpacking of the various theoretical frameworks that have implicitly guided some of the empirical work on the effectiveness, outcomes, and structuring of case pedagogy. Using case methods as a pedagogy has been located in a variety of learning theories to support their use as a learning tool. We reviewed situated cognition theory (Lave and Wenger, 1991), cognitive flexibility theory (Spiro et al., 1987), social cognitive theory (Bandura, 1986), reflective practice (Dewey, 1933; Schon, 1987), and practical reasoning (Dunne, 1993, based on Aristotle's concept of *phronesis*). We found that the empirical articles we reviewed often conflated multiple theoretical framings for why and how cases were used to support pre-service teacher learning. The articles that drew across multiple theoretical frames tended

to be less theoretically robust than those that clearly identified a specific learning theory for exploring what learning was occurring and how that learning took shape.

We highlighted a few studies that clearly grounded their research within a particular learning or reasoning theory in order to illustrate how particular frames on learning supported a more consistent and deeper analysis of how cases were mobilized pedagogically and defined the learning that resulted within specific contexts. Ultimately, we concluded that case methods have been adopted as a pedagogy because they tend to represent the complexity of practice and provide an opportunity for pre-service teachers to locate their learning in the particulars of practice while also drawing on educational theories to understand their practice. We summarized: "Thus, case methods have the potential to not only situate the learning of the teacher in a particular context but also to provide opportunities to theorize from practice while practicing theory (Sato and Rogers, 2010, p. 596). This conclusion drew on the work of Judith (Judy) Shulman who wrote about a "vision of teaching as a deeply professional and profoundly complex form of theoretically enriched practice." (2003, p. 2). We want to acknowledge Judy Shulman's foundational idea about learning to teach here and dedicate this article to her in recognition of her passing in 2021. She is a great loss to the field of teacher education research, especially with regard to case methods as a pedagogy.

Recent research on the impact of case methods in teacher education

For this article, two advanced searches of standard education databases and a Google Scholar search using "case method" and "teacher education" as keyword search criteria since 2010 were conducted. We found that no systematic research review on case methods in teacher education has been published in educational research journals since the 2010 Encyclopedia article was published. Through this review, 34 papers that represent empirical studies of case methods in teacher education published in English were found, as well as a review of case methods and its relationship specifically to preservice teacher decision-making covering the time period of 1990–2010 (Çevik, 2013). We first summarize the review by Çevik (2013) and then summarize the 34 research studies.

Çevik (2013) defined teacher decision-making as teachers' thought processes, reasoning, and instructional decision-making (p. 94). The author divided the 20 reviewed studies into four groupings: four studies of pre-service teachers using video recordings to analyze their own teaching; two studies of pre-service teachers analyzing exemplar case studies; eleven studies that used cases as sources of inquiry and problem-solving; and three studies in which pre-service teachers constructed their own cases for analysis. Çevik (2013) found that the use of case study can influence the growth and development of a preservice teachers' decision-making capabilities, such as seeing situations through multiple perspectives, using evidence to support claims and interpretations, and their ability to generate alternative solutions to problems and situations. Some limitations to the use of cases for the development of teacher decision-making included how the preservice teacher often relies on the word of perceived experts rather than their own careful case analysis, superficial analysis of complex situations due to the inexperience of the preservice teacher, and pre-existing beliefs and prior experiences guiding preservice teacher decision-making. Using the framework of novice-to-expert development, Çevik (2013) concluded that the use of case study pedagogy can enhance the development of expertise in teaching, but that the development of expertise still takes time. The particularities of the pedagogical approach of case method that were reported in the research studies was also an important factor in preservice teacher learning. Çevik reports that the integration of case discussion and analysis enhanced learning and multiple exposures to case analysis over time resulted in stronger learning outcomes.

The 34 research studies published since 2010 show that case methods are being used around the world as the studies are located in Australia, Austria, Canada, two from Germany, Hong Kong, Ireland, Israel, Japan, Malaysia, three from Taiwan, South Africa, Switzerland, five from Turkey, Great Britain, and 13 from the United States. In terms of teacher learning through case methods, these studies explore learning in curriculum areas of English, physical education, mathematics, music, reading, the sciences, and social studies. Other areas of teaching knowledge were also present in this set of studies, including professional ethics and moral reasoning, adolescent development, classroom management, culturally relevant pedagogy, and technology integration. Aspects of teaching such as understanding the complexity of teaching, teacher problem-solving, analytical thinking within situations, and the special context of teaching in rural areas were also represented. We also noted cases across the schooling sectors of early childhood, special education, secondary, and primary within this collection.

Substantively, these studies tend to ask questions about the effectiveness of the use of case studies as a pedagogy in terms of how they support a learning outcome for preservice teachers. Twenty of the studies report a positive outcome for preservice teacher learning in areas such as improving attitudes toward chemistry (Ayyildiz and Tarhan, 2012); using theoretical understandings in decision-making (Ching, 2014); learning about how students learn math (Osmanoğlu and Koç, 2013); analytic thinking ability (Frommelt et al., 2019; Zottmann et al., 2011); and fostering learning of culturally responsive pedagogies (Gunn et al., 2015).

Three studies showed that preservice teachers do not always respond to learning from case studies (Liu and Chen, 2019; Shin et al., 2019; Tal, 2010). Given that these studies are counter-narratives to the general consensus of effectiveness of case methodology, we will look at these three studies more closely. Liu and Chen (2019) set out to study how the use of case methods impacts preservice teachers' reflective thinking through their own action research in a teacher education course on "education issues" in a Taiwanese national university. Two issues were addressed using video cases followed by discussion and a group written reflection. Using a questionnaire about the preservice teachers' awareness of the education issue and qualitative analysis of the post-case discussion analysis, the authors concluded that the use of case study was effective at supporting and developing reflective thinking, but it did not alter students' fundamental viewpoints on the particular issues that the case addressed.

Tal (2010) asked students in a second-year teacher education course in Israel to construct cases from practice as a way of exploring and learning about classroom management as a complex activity. The cases were written using social episode analysis, in which they chose an episode from their experience, interpreted and analyzed it in terms of the classroom management theories learned in their course, their own effectiveness, and what could be improved in the future. The preservice teachers then selected a second episode to reflect on how they had improved their coping strategies within a similar situation. Of the 34 cases written by preservice teachers, the author chose two to showcase in this study. One case illustrated strong learning and development based on the course expectations and that classroom management practices began to align with the theoretical perspectives of moral and ecological approaches taught in the course. The second case illustrated how a preservice teacher seemed to miss learning opportunities in the case analysis, made leaps and assumptions about the students she was teaching, and stood firm in her personal beliefs about corrective punishment and obedience to authority as the classroom management approach she was trying to enact, which did not align with what she was taught in her teacher education course. The authors conclude that the case writing was beneficial to the students to develop their understanding and provided an avenue for analyzing practice. However, the case writing exercise was not sufficient for ensuring that all students fully embrace particular teaching approaches taught in the course, especially when fundamental beliefs are held onto. The authors also suggest that more time or more coaching of the preservice teacher who wrote the second case highlighted in the study could help further develop understanding and improve practice.

The third study in this set illustrated how preservice teachers' perceptions of the cases themselves can influence their learning process. Shin et al. (2019) explored the perceptions and experiences of the use of technology-enhanced cases with two cohorts of students in a social studies methods course in a United States university. The students reported both positive and negative perceptions. The preservice teachers reported that case methods provided students with a medium for sharing ideas and an authentic window into the details of teaching. Some of the preservice teachers within both cohorts also reported that they did not believe the cases were authentic to real practice they had observed in schools and that the classrooms in the videos appeared to be too controlled. The preservice teachers suggested in interviews that the lack of classroom management issues in the videos made it more difficult for them to engage in case analysis. The teacher educator facilitating the case discussions reported that even though the video cases were real teaching videos and not staged, the preservice teachers seemed to hold a view of classroom management that is uncoupled from well-designed and effective teaching that engages students. The authors suggest in using case study pedagogy, having case materials is not enough on their own to support student engagement; learning needs to be supported through providing a purpose, context, scaffolding, and facilitation.

Finally, one study stood out as atypical in its approach to examining case methodology. Burns et al. (2012) provided a philosophical argument about the assumptions embedded in a widely-used education ethics textbook that relies on case method (Strike and Soltis, 2009). This paper argues that the case method approach that Strike and Soltis (2009) advocate, which seems to be based on highly structured cases, develops dialogic competence but falls short of developing practical competence in ethical decision-making. The authors suggest other pedagogies that examine real situations from practice or more nuanced accounts from literature rather than the constructed and guided case analysis provided by the textbook under review.

Recent research on the construction of case studies in teacher education

Within this group of 34 studies, eight focus on the construction of cases and the features of case studies that contribute to teacher learning. For example, Kurz and Batarelo (2010) explored the features of case studies that primary school preservice teachers perceived as beneficial in video case studies and found three features that were considered constructive: (1) modeling of teaching techniques; (2) supplemental materials to support the video case; and (3) observing classroom management. McLinden et al. (2010) reported on the development of online, problem-based learning case scenarios for use in a distance education program for teachers of students with visual impairments. The authors tested the prototype cases with a group of 36 teachers enrolled in an advanced teaching qualification program in a UK University. Using questionnaires, the authors were able to gather feedback on how the online case design aligned with their design principles and get recommendations for further development. Saltan et al. (2016) used action research cycles to design and develop online case-based learning environments for primary preservice teachers at a university in Turkey. The online environment allows the preservice teacher to watch video cases and analyze them using scaffolds such as a structure for the case analysis, peer discussions, question prompts, and an expert response to the case. Using data from interviews and questionnaires, the authors identified six factors that contributed to the authenticity of the cases: commonness, providing different perspectives, filling emotion, holding experience, reflecting social facts, and being multimedia.

The self-construction of cases by preservice teachers has also been further explored in two of the studies located in this review. Rosaen et al. (2009) asked what teaching interns learn when they make their own video cases from their own teaching. The study zeroes in on how the perceived audience of the video cases shaped how the teaching interns presented their cases, what they chose to focus on, and what they learned from the case construction. The authors found that while all the preservice teachers demonstrated learning through the process of making a video case, the question of who was the audience for the video cases was important for the preservice teachers to understand in order to support their learning in particular areas.

Tulu (2016) explored how preservice teachers in an English language teaching program in Istanbul engaged in writing cases based on their practicum observations and reflecting on the cases collaboratively. Using post-course written reflection and focus group interviews, the author sought to identify the effect that the case-writing had on the students' learning. Preservice teachers reported that writing the cases based on their own practicum observations motivated them to better engage in the practicum

experience, to notice more during their observations, and that writing the cases created a meaningful learning experience for them. Constraints identified by the preservice teachers mainly centered on how to manage the time for sharing the cases written by the preservice teachers to ensure that all the cases get shared and discussed as part of their learning process.

Tinker Sachs and Ho (2011) describe the process of developing and field-testing cases used in a Teaching English as a Second Language teacher education program in Hong Kong. The cases were subsequently edited and published in a book (Tinker Sachs and Ho, 2007). The authors describe five stages of development of the case studies: (1) identifying the teacher participants; (2) interviewing the teacher participants for contextual background; (3) videoing lessons of the teacher participants; (4) preparing cases through episode selection and question generation; and (5) testing and refining the cases with the teachers and with preservice teachers. The article also describes the case structure and outlines the case pedagogy.

A novel use of cases in teacher education is to feature them as an evaluation or assessment tool within a teacher education program. Wagler (2009) used case narratives as an evaluation tool with primary preservice teachers taking a science methods teaching course in a US university. The author constructed two cases that depicted a positive and a negative science teaching case narrative based on using pedagogies of scientific inquiry (National Research Council, 1996). Preservice teachers were presented these cases randomly and asked to evaluate them in light of effective science teaching criteria as a means of determining if the preservice teacher could discern this type of science teaching.

The question of differential learning by preservice teachers with different backgrounds was explored by Liu (2013). This study examined the differences that preservice teacher characteristics make in terms of learning outcomes using dilemma-based cases in primary teacher education. Men achieved better results than women (contradicting previous research reports); those with no prior teaching experience achieved higher than those with prior experience; and the academic level of the teacher education program did not make a difference in terms of learning outcomes.

What have we learned from these recent research studies?

This collection of studies continues to support the efficacy of case study methods as a pedagogy that supports preservice teachers in developing their understanding of concepts and knowledge base, reasoning ability, and analytic thinking. Case methods are generally engaging for preservice teachers as they are based in authentic experiences, either derived from others or harvested from their own experiences. And case methods provide a tangible approach for building the relationship between theoretical understandings about teaching and learning and the practical decision-making in the enactment of teaching in everyday terms.

The limitations of the use of case methods are both pedagogical and practical. Pedagogically, the teacher educator must know how to position the case method in a scaffolded and facilitated way that helps the preservice teacher understand the purpose and the context of the case (Shin et al., 2019). Details about how to introduce and engage in case discussions continue to add to the field's understanding of how to enact this pedagogy (Tinker Sachs and Ho, 2011). The pedagogical practice of using case methods can be particularly rewarding and challenging when preservice teachers are asked to construct their own cases (Rosaen et al., 2009; Tuluze, 2016). This requires teacher educators to be clear on the purpose and audience for the case so that the preservice teacher can select and construct a case narrative that allows them to explore the required theoretical aspects of teaching, analyze and reflect on their own learning at the depth expected by the profession, and to share their case appropriately with others for collaborative learning from practice.

As a set of research studies, it appears that the field of teacher education is not fully embracing a research program (Sato and Sheppard, 2008; Shulman, 2004) around case methods in teacher education. Many of the papers find their roots in case methods in teacher education by citing some of the original arguments and research base for using cases as a pedagogy in teacher education (Lundeberg et al., 1999; Merseth, 1996; Shulman 1986). From there, the studies tend to diverge across a variety of theoretical frameworks such as professional socialization (Hemphill et al., 2015; Richards et al., 2012); reflective learning (Liu and Chen, 2019; Rosaen et al., 2009; Tuluze, 2016); narrative learning (Ayyildiz and Tarhan, 2012); phronesis and reasoning (Burns et al., 2012); planned behavior (Dündar, 2019); professional vision (Frommelt et al., 2019); cognitive learning (Kale and Whitehouse, 2012); transformational learning (Kindle and Schmidt, 2011); ill-defined problems (Koç, 2012); problem-based learning (McLinden et al., 2010); cognitive moral reasoning (O'Flaherty and McGarr, 2013); gamification (Heffernan et al., 2016); computer mediated communication (Osmanoğlu and Koç, 2013); social episode analysis (Tal, 2010); and cognitive flexibility (Zottmann et al., 2011). The most common theoretical space for these studies was in social constructivism (Ching, 2014; Florez, 2011; Gravett et al., 2016; Howell, 2012; Ohara and Edahiro, 2010) which is a broader epistemological stance as compared to the more specific concepts grounded in learning that the other studies used. Two studies had no discernible theoretical framework (Kurz and Batarello, 2010; Tinker Sachs and Ho, 2011) and five studies argued for case methods being used and studied within a framework of professional knowledge (Günther et al., 2019; Schritteser, 2014), exemplary practice (Mayall, 2010), and the theory-practice gap (Gravett et al., 2016; Shin et al., 2019). Two studies by the same author (Liu, 2013, 2019) went as far as to name the use of cases as a pedagogy as "case learning," maybe inadvertently making a move to name a new way of theorizing learning from cases, but the author did not go into an explicit discussion about how this might actually be introducing a learning theory in and of itself. This suggests that individual researchers are studying a pedagogical approach and its outcomes without much concerted focus on theory building within the field.

Proposing next steps for case methods practice and research

With only 34 research studies identified from a ten-year period, we suggest that case methods in teacher education seems to be so well accepted as a standard pedagogy, the allure of exploring its nuances through research activity seems to be waning. During a period of teacher education that saw a turn back toward practice (Ball and Cohen, 1999; Ball & Forzani, 2009; Grossman, 2011; Reid, 2011; Zeichner, 2012), we wonder if case pedagogy has become an everyday teaching practice and is not deemed as “research-worthy” as it was when it was novel in the 1990s. We contend that there is still much more work to do in understanding the role of, the practice of, and the impact of case methods in teacher education, as we discuss in the next section. To propose the next stages of a research agenda for case methods in teacher education, we return to the original theorizing of case methods in teacher education from Lee Shulman (1986).

Exploring a case-based knowledge system for teaching

When Shulman (1986) introduced the idea of the use of cases in teacher education, he originally spoke of cases as one way to shape the knowledge base for teaching. Shulman provided a framework for the knowledge base for teaching and proposed three forms of teacher knowledge—propositional knowledge, case knowledge, and strategic knowledge. Propositional knowledge is descriptive or declarative knowledge; the ideas and facts that we hold to be “true,” or more often described in teacher education as “research-based.” Strategic knowledge is how you know what to do in a situation; knowledge that supports the actions you choose such as contextual knowledge and knowledge from experience. Shulman described *case knowledge* as “knowledge of specific, well-documented, and richly described events... [in which] the knowledge they represent is what makes them cases” (p. 11). Shulman spoke to both the substance of the cases and the pedagogical function that a case can serve by describing three types of cases: prototypes that exemplify theoretical principles; precedent cases that capture and communicate principles of practice or maxims; and parables that convey norms or values.

What we have seen in teacher education since Shulman’s original proposal (1986) are discussions and debates about a “knowledge base” for teaching that has been organized around paradigmatic content themes such as disciplinary subject matter knowledge, pedagogical knowledge, and knowledge of learning and child development (see, for example, Council of Chief State School Officers, 2011). Shulman’s work itself led teacher education down this path with his 1987 article *Knowledge and Teaching: Foundations of the New Reform*. Identification of a knowledge-base for teaching has grown into the global phenomenon of professional teaching standards, with many jurisdictions around the world having constructed their frameworks for what teachers should know through the framing of professional standards for teachers (Darling-Hammond et al., 2017; Sato and Kemper, 2017).

There have been some attempts to disrupt the idea of a knowledge base that is thematically organized into discrete domains. Hugh Sockett (1987) wrote a rebuttal to Shulman’s knowledge-base argument and asked, “has Shulman got the strategy right?” Sockett posed his questions from a moral philosophy lens and asked, if we use a metaphor of a knowledge base, and we rely on the technical language stemming from the field of psychology, might we be putting the moral dimensions of teaching out of view? More recently, Sinnema et al. (2017) posed a new framework for professional standards for teaching based in a framework of professional inquiry that is a deeply embedded concept in teaching practice in New Zealand where the authors are located. These authors attempt to disrupt the commonly accepted approach to constructing standards as lists of knowledge domains and indicators that appear discrete in how they are described and assessed. They outline an integrated model that foregrounds the active and complex nature of teaching and teacher learning through inquiry as it is experienced in practice and often through the lens of values, ethical considerations, and dispositional considerations.

Shulman and Wilson (2004) argued that a vital source of legitimate knowledge for teachers, as professionals, comes from the “wisdom of the practice itself” (pp. 232–233). This is to say that the knowledge base for teaching could be viewed less as a collection of things to “know,” and more as the practical understandings and wisdom that result from the “process” of becoming a teacher itself. Shulman (2004) also insisted that stories from teachers that involved pedagogical action, thinking, and reasoning are not isolated tidbits of information collected over the course of an education program or a career, but rather are constitutive of and resultant from the practice of teachers. This suggests that teacher narratives are simultaneously the knowledge base for teaching as well as the process by which a teacher develops competency and fluency in teaching. In other words, a teacher develops the “wisdom of the practice” through practice, and is, at the same time, defining what that wisdom is as they work to actively construct a teacher life (Knaus, 2020).

The epistemology of story suggests that meaning is found in the stories that we tell, the stories that we live, and the stories that we experience—in the particulars of a situation rather than general principles. Bruner (1986) advocated for the storied nature of human life as how humans understand, interpret, and learn from experience by constructing stories and listening to the stories of others. From this narrative stance, knowledge and the meaning of that knowledge is communicated as much through story as through the construction of logical arguments. Sharing knowledge then becomes a process of story construction and storytelling. The power of the story for sharing knowledge is linked to its detailing of events that unfold over time in a particular place (Clanin and Conelly, 2000). Knowledge as story engages our attention, captures our interest, allows us to relate to other human experience in intimate ways, and has the potential to create a connection that helps us retain the story in our memories. However, sense-making from stories can be challenging in academic spaces. We often revert to propositional knowledge and interpret the

story through the lens of accepted theoretical perspectives, categorical coding, and technical definitions. Once we make this interpretive move—transforming a story from its whole form to a set of categories or lessons to be learned—we run the risk of decontextualizing the knowledge that is bound up in the story through the very nature of the story being the knowledge, not the source of knowledge.

We propose that the field of teacher education could more systematically explore what it might mean if we returned to Shulman's original notion of cases as representing the knowledge of teachers. The literature on case methods in teacher education has primarily (or possibly only) focused on the method as pedagogy—for learning through case construction, examination, and analysis. We are proposing that the identification of cases as a way to structure the knowledge for teaching through narrative forms should be more carefully considered within teacher education, as [Shulman \(1986\)](#) originally proposed.

The knowledge base for teaching as based in this narrative epistemology would not be a monolithic entity. It would be created and re-created in each teacher as they persist in becoming a teacher. This is not to assert, however, that the knowledge that teachers possess and use in their teacher lives ([Knaus, 2020](#)) is unique to them, and different from that of every other teacher. There is a reason why the stories that teachers tell resonate with other teachers. They have shared, common themes and understandings, however colored in ways that are specific to each and the contexts in which they teach. Teachers then find meaning, opportunities for growth and purpose in their own stories, the stories of other teachers, and the connections that they make between them. This conception of teacher knowledge is what [Fenstermacher \(1994\)](#) described as “knowledge of teachers” (p. 11), the practical knowledge that comes from practice. This stands in contrast to what he termed “knowledge for teachers” (p. 9), which is formal “theoretical and propositional knowledge” ([Verloop et al., 2001](#), p. 444) that is scientifically and empirically derived. There is room for both in the broad view of the knowledge base for teaching. But what if we focused on the knowledge base for teaching as understood through the medium and epistemology of narrative, or cases? We might study case methods with questions such as: What do the stories we select as cases illustrate about teaching practice? How do the stories we select help preservice teachers understand the complexity of teaching? Are there iconic cases that sit at the core of our teacher education programs; that convey the values and meaning of learning to teach? Can we represent the complexity of teaching narratively?

Curating a case-based knowledge system for teaching

The idea of curating teachers' stories in the service of constructing teacher knowledge has three elements to it. The first is on a personal level. Humans internally curate our own experiences, both consciously and subconsciously. Preservice and inservice teachers as well as teacher educators have a multitude of stories and pedagogical episodes that we could document and share. We select stories to tell others. Researchers have also identified that teachers have secret stories, lived out in their classrooms and that stay relatively secret within those autonomous spaces ([Craig and Olson, 2002](#)). When these stories are told to other teachers, they are told generally in “safe spaces that they or others have created or found” ([Craig and Olson, 2002](#), p. 25). The second type of curation is interpersonal. This is curation done in conjunction with other people, for example in inquiry groups, learning communities, and amongst professional colleagues. This mutual curation allows one story to connect to and elicit another story. Teacher education programs create these opportunities when they ask their preservice teachers to construct their own cases (e.g., [Rosaen et al., 2009](#); [Tuluze, 2016](#) in the set of studies reviewed in this paper). A caution to note in this interpersonal curation is that when teachers move out of the classroom into more public spaces in their professional knowledge landscapes ([Clandinin and Connelly, 1995](#)), teachers “often live and tell cover stories, stories in which they portray themselves as experts, certain characters whose teacher stories fit within the acceptable range of the story of school being lived in the school” ([Craig and Olson, 2002](#), p. 25).

The final form of curation is formal curation. This is a more structured and “official” form of curation that might occur in a teacher education program or a professional development scheme for teachers. This form of curation is what we see in case books (e.g., the work of July Shulman), collections of video cases of teaching practice (e.g., [Tinker Sachs and Ho, 2007](#) in the set of studies reviewed in this paper), and websites (e.g., [Hatch and Pointer, 2007](#)). Compiling these collections is intense work and they are necessary tools that advance the pedagogical practice of case methods. We propose that research on case methods in teacher education could examine the processes of curating cases with attention to questions of how these cases represent the knowledge base for teaching. Through the act of curating teachers' stories, teacher educators can build on [Shulman's \(1986\)](#) vision for types of case knowledge that serve as prototypes that exemplify theoretical principles; that set precedent by capturing principles of practice or maxims; and that hone norms or values through parable.

The role of a curator is a complex one. Professional curators and docents at art museums select the works and arrange tours of the museum in a way that presents the works as parts of a larger whole, as building blocks for constructing a larger understanding of art and how the viewer constructs meaning. As Lucy Worsley, a professional curator in the United Kingdom explains, “people think that curating just means choosing nice things. But this is only half of it. Our real job as museum curators is to look after artifacts from the past, yet also to be the repository of knowledge about them” (“People Think Curating Just Means Choosing Nice Things”, 2016, emphasis in original). This suggests there is a layer of understanding involved in formal curation of knowledge for teaching through cases. Curating stories is, like teaching, an intensely human and personal endeavor, and the possibility for one's biases to influence the process is high. Similarly, there is a risk of one's own views of worthy cases of becoming the dominant (or only) source of narratives. Who chooses the cases? When preservice teachers construct their own cases, what do the cases represent? A critical lens on questions of curation will be imperative.

Narrative spaces in teacher education

Creating narrative spaces within teacher education programs is necessary if case methods are to be used seriously and to their full potential. The contours of narrative spaces, like most aspects of education, is context-dependent. That is to say that what a narrative space might look like—physically, emotionally, and intellectually—may differ from program to program. More in-depth study of how these spaces function as a narrative space is another aspect of case methods that appears under-represented in the research studies we examined here. These studies might include how cases are embedded programmatically in teacher education; the ways that programs or individual courses do (or do not) promote the telling and hearing of teachers' stories; the purposes for which these stories are shared; how stories compete with other aspects of the program; and how stories are cared for in their whole form as well as the deconstruction that takes place during case analysis.

Other larger contexts and forces that influence learning in teacher education could also be examined through studies of narrative spaces. For example, the examination and understanding of the role that race, language, culture, religion, class, as well as a host of other issues, such as immigration status, first generation college graduate status play in the ways in which teachers' stories are told and heard give meaning to the social construction of knowledge and experience. It is important to note that the telling and hearing of teachers' stories is not done only by teachers, but by the public as well. This suggests that there may be an opportunity to explore cases from media sources, policy discourse, and communities that further illustrate teachers' work and practice outside of the first-hand lived experience.

Conclusion

From the collection of studies in this review, we conclude that case methods in teacher education remain a pedagogical approach that has impact on learning and is still developing in terms of understanding the nuance of the construction of cases for learning. The field of teacher education also seems to struggle with establishing broader programs of research across multiple investigations that build theory or use theory to develop a more robust analysis than is possible with one researcher working in what appears to be isolated contexts.

Schritteser (2014) (one of the studies in this review) provides a conceptual discussion about the use of case study in teacher education, summarizing that case methods should allow teacher education:

- to cultivate a receptive, context-sensitive attitude, and the comprehension skills which are essential to encouraging deep learning in students;
- to foster observational and diagnostic skills which are central to monitoring student progress and potential;
- to learn to analyze the specifics of a situation in order to find out what is the case and why it is an instance of a more general question, which becomes relevant given the dual commitment of teachers both to society and to the individual student;
- to try and bridge the gap between doing practice ones self and reflecting on practice incidents as an exercise in deliberate practice, which in turn is crucial for the growth of expertise in teaching. (pp. 192–193)

These elements of case pedagogy are reminiscent of Shulman's (1987) original arguments for case methods in teacher education and the empirical literature seems to be bearing out these early propositions. We propose, however, that there is room to advance case methods in teacher education to be more akin to Richert's (1991) argument that the descriptive nature of cases "provides an opportunity for presenting teachers' work in all of its complexity" (p. 136). If we accept story as knowledge, then how can teacher education better represent teacher knowledge through these stories? This may be our next big challenge.

What is anti-racist education?

Anti-racist education confronts and dismantles institutional Whiteness and systemic racism and oppression in education (Dei, 1995, p. 13). It focusses not only on individual discrimination and prejudices, but examines how “racist ideas and individual actions are entrenched and unconsciously supported in institutional structures” (Dei, 1995, p. 13). The work of Barbara Thomas

(1984) identifies five conditions that must be met for socially transformative anti-racist education to take place, which include: (1) Creating safe spaces where injustice can be critically examined from multiple perspectives; (2) Investigating the survival strategies among those with lived experiences of racism; (3) Facilitating opportunities for skill development in order to resist oppressive conditions; (4) Engaging members of the dominant culture and those who experience racism in examining how racism is resisted; and (5) Challenging racism in all its forms through informed collective action (Thomas, 1984 as cited in Fredericks et al., 2001).

Theoretical underpinnings of anti-racist education

Anti-racist education has roots in a number of theoretical traditions, and has evolved from context-specific fields of practice including Culturally Responsive Pedagogy, Ethnic Studies, multicultural education, liberatory education, Critical Race Theory, Critical Whiteness Studies, Intersectionality, and anti-oppressive approaches to education.

Culturally Responsive Pedagogy (CRP) and multicultural education seek to improve the academic performance and curricular inclusion of Indigenous, Black, and students of color, and critical forms of CRP hold overlapping values and strategies with anti-racist education. When done in isolation from specific anti-racist education, however, “cultural” approaches used by White teachers can reassert the very dominance that they seek to address (Gebhard, 2018; St. Denis, 2007). That is, uncritical CRP and multicultural education locate cultural difference as the problem, rather than systemic racism, and their basis for change focuses on techniques alone. These approaches are foundationally different from critical approaches, whose praxis are based in social critique and engagement in informed action. In our review, Critical Race Theory and Critical Whiteness Studies were the most commonly cited theoretical basis for anti-racist education work.

Critical Race Theory (CRT), which has roots in legal studies, has offered anti-racist education several key concepts. The principle of “racial realism” contends that although race is not a biological construct, it is a permanent and enduring feature of societal structures (Bell, 1992). CRT also stresses the necessity of “counter-narratives” and storytelling, as a way of describing the racial discrimination that Indigenous, Black, and people of color experience in their everyday lives, in an effort to make racial biases, discrimination, and unstated normative assumptions more visible (Brown and Jackson, 2013, pp. 19–20).

Ladson-Billings and Tate (1995) describe Critical Race Theory as attending directly to institutional and structural racism in education. Solórzano (1998) further argues that CRT “challenges the dominant discourses on race and racism as they relate to education by examining how educational theory, policy, and practice are used to subordinate certain racial and ethnic groups” (p. 122). By recognizing race as an ideological construct that has every-day consequences for people and groups, and by working to change policies and practices that uphold racism and other interlocking forms of oppression on individual, cultural, and systemic levels, CRT in education is “active”, which is to say that it works through particular practices and has specific outcomes (Delgado and Stefancic, 2001; Ladson-Billings, 1998; Ladson-Billings and Tate, 1995; Omi and Winant, 1994; Solórzano, 1998).

Theorizing about systems of Whiteness, such as through the early works of racial scholars like Du Bois (1903/2017) and Baldwin (1962), has offered further avenues for critical race studies. Harris’ (1993) concept of “Whiteness as property” describes the way that legal systems have been structured to protect property, and that Whiteness allows for greater social and economic security as a result (Brown and Jackson, 2013, pp. 19–20). Mills (1997) contends that White supremacy, as a political system, constitutes a “racial contract”, where dominance and privilege have been so normalized for White people that they do not see this domination as political (pp. 1–2). Goldberg’s (1993) work on historical installation implicates educational institutions, in particular, in the reproduction of racializations and racisms as “common sense” (Goldberg, 1993, p. 12). Critical Whiteness Studies (CWS) builds on these works, including through Frankenberg’s (1993, 2001) feminist theory of Whiteness, Leonardo’s (2004, 2009) theory of Whiteness as ideology, and through what are considered “second-wave” practitioners, who have shifted a focus from White privilege to White supremacy (Leonardo, 2013; Jupp and Lensmire, 2016; Mason, 2016).

Frankenberg (2001) describes Whiteness as the relationship of dominance between White people and the Other (racially minoritized groups), enacted through individual, interpersonal, cultural, and institutional levels. Whiteness is at once a structural advantage, a set of cultural practices, and the unmarked, unnamed norm upon which all others are compared and subjected to (Baldwin et al., 2011). Leonardo (2004, 2009) similarly describes Whiteness as an ideology, forged through historical domination, and kept in place through an enduring series of actions, policies, and laws.

Aveling (2006) argues that “the critical examination of Whiteness is part of a larger project of anti-racism because for too long we have focused on the shortcomings perceived in the ‘Other’ and equated race with ‘studying down’ in the power structure” (p. 263). A focus on Whiteness turns the gaze toward those teachers and educators who play a role in sustaining racism (Carr and Lund, 2007; Case and Hemmings, 2005; Evans-Winters and Hoff, 2011; Fine et al., 2004; Frankenberg, 1993). While the first wave of Critical Whiteness Studies focused on White privilege discourses, second-wave CWS focuses on opening up possibilities for White people to become racially conscious, and to learn about White dominance, supremacy, structural injustice, and the socially constructed nature of identities, rather than individual privilege (Jupp and Lensmire, 2016). In this way, CWS asks teacher candidates to understand the discursive nature of their identity construction, and that racial identities are continually performed and can be transformed. Critical Whiteness Studies also seeks to understand White teacher candidates’ resistance to learning about these discursive reproductions, institutionalized racism, and White supremacy, in an attempt to uncover ways of penetrating this resistance in education.

The Whiteness of teaching and teacher education

The homogeneity of teaching forces in settler colonial and “Western” countries, where teachers are overwhelmingly White, reinforces a structural chasm between the experiences and knowledge of Black, Indigenous, and students of color and their White

teachers (see Miller, 2016; Ryan et al., 2009; Sleeter, 2017). Teacher education programs have similar structural problems. Teacher candidates of color report a lack of peers with similar perspectives and experiences (Brown, 2014), sparse minority role models (Szecsi and Spillman, 2012), and a lack of diversity among teacher educators (Jackson, 2015).

The need for diverse instruction and anti-racist education is not only a demographic issue, as the culture of Whiteness also pervades the structure of education programs with discursive, curricular, and pedagogical implications (Brown, 2014; Cheruvu et al., 2015). Anti-racist education must also therefore attend to the structural power dynamics that demographics often represent, in order to reduce the likelihood that White teachers “will endorse a political and social system that perpetuates White nationalism” (Dei, 2001, p. 150). Levine-Rasky (2000a) has argued that “programmes oriented toward preparing educators to effectively teach to diversity are themselves identified as a crucial element in the failure of equity education” (p. 272), and that it is only through an identification of the ways that Whiteness pervades process, policies, and practices that teacher education can begin to challenge and change these structures in education (Levine-Rasky, 2000a).

Experiences of Black, Indigenous, and teacher candidates of color

Schools and teacher education programs are reported to participate in silencing Black, Indigenous, and teacher candidates of color. The Whiteness of teacher education curriculum, the student body, and faculty ensure that the experiences and knowledge of teacher candidates of color are rarely acknowledged, much less affirmed. Programs “do not extend [build] upon life experiences and cultural knowledge bases of teacher candidates of color” (Jackson, 2015, p. 225.), and neglect to prepare these teacher candidates for the realities of a predominantly White profession (Kohli, 2019, p. 48). Subsequently, teachers of color often cite school climate and lack of voice as reasons for leaving the profession (Gist, 2017, p. 951).

The reaffirmation of the dominance of Whiteness occurs in various explicit and implicit ways. For example, students of color are often positioned as objects—but ignored as participants—in multicultural teacher education (Montecinos, 2004). Through “excluding, silencing and ignoring the presence of preservice teachers of color ... teacher education is, paradoxically, securing the norm of Whiteness in teacher preparation” (Montecinos, 2004). Black and teacher candidates of color are also frequently positioned as “newcomers”. This framing means they “must primarily rely on the ‘expertise’ of predominantly White teacher educators to learn how to teach in socially just and culturally relevant ways” (Pham, 2018, p. 55). Despite having experience that would position them as “knowers”, or even experts, professors hold lower expectations of these candidates, and they are often constructed as having a deficit (in particular if they speak another language) (Brown, 2014).

This Whiteness of teacher education courses also serves to deny racism and perpetuate racial stereotypes. African American preservice teachers attending a predominantly White teacher education program, for example, witnessed White classmates who simultaneously dismissed the continued existence of racism in US society, while also expressing stereotypes. The African American teacher candidates felt unfairly burdened by the responsibility to counter these racial stereotypes (Brown, 2014, p. 335). Teacher candidates of color also battle assumptions that they will automatically become culturally responsive or anti-racist teachers because of their race, ethnicity, or culture. Even being asked to speak their voice – sincere as it might be – can tokenize and humiliate teacher candidates who do not offer a critical analysis of their marginalization. The result can be an added level of feeling alienated and inadequate, and causes them “to develop feelings of distrust and alienation toward their teacher education program” (Brown, 2014, p. 335).

Teacher candidates also struggle to embrace their own cultural and linguistic heritage while negotiating the expectations of White teacher education programs (Haddix, 2012, p. 170). Latinx teacher candidates, for example, feel pressure to accommodate White normative behaviors in order to succeed in their program, including acting in ways that are culturally unfamiliar and that feel inauthentic to the participants (Brown, 2014, p. 335). Such conflicting demands on teacher candidates of color “wears them down” (Achinstein and Ogawa, 2011 in Pham, 2018, p. 54), and they are then more likely to become “absorbed in the system through a process in which they internalized institutional values” (Gist, 2017, p. 946).

Given the obstacles faced by Black, Indigenous, and teacher candidates of color, their inclusion in teacher education programs remains tokenistic. While being celebrated and acknowledged for diversifying primarily White programs, teacher candidates themselves perceive that their presence “is only for statistics” and that their well-being is not a concurrent consideration (Jackson, 2015, p. 231).

The necessity of anti-racist teacher education

Programmatic challenges

The manifestation of a culture of Whiteness is observable in teacher education programs through a host of ways including: policy, recruitment and retention of diverse faculty and teacher candidates; through course curricula and sequence; assumed course audiences; the nature and structure of practica and community placements; how equity and methods courses are integrated (or not); and the degree to which teacher educators resist or are willing to engage in anti-racist work in their own courses. All of these routine processes and programs can be examined for how they enact a culture of Whiteness in education.

Lack of adequate anti-racist policies

Ineffective or non-existent anti-racist policy at the program level may work to counteract other equity program goals (Gist, 2017). For example, “invisible practices of faculty that deny or ignore cultural and linguistic differences among teacher candidates may offset the culturally responsive program design efforts” (Gist, 2017, p. 945). Course evaluation policies, for example, can penalize

teacher educators who teach racial equity courses, by receiving negative feedback from candidates who are not willing to learn about racism (Milner and Howard, 2013; Evans-Winters and Hoff, 2011). Programs may also primarily support research that is interested in how White teacher candidates think and develop their pedagogy (Jackson, 2015), while devaluing cultural and linguistic connections of diverse students through a lack of faculty and student diversity (Gist, 2017, p. 946).

Siloed equity courses and practica structure

Equity content is typically siloed into specific, often one-term courses with the unfortunate effect that they may be inadequately supported by managers and colleagues who are dismissive of anti-racism (Jackson, 2015). Typically, equity and diversity courses also assume a White audience, and are not being created with students of color in mind (Gist, 2017; Jackson, 2015; Kohli, 2019). In addition, programs that have not been designed in consultation with the communities that they seek to serve can reinforce unconscious racism on the part of both teacher candidates and teacher educators. Teaching placements, for example, where mentor teachers and student teaching supervisors unconsciously and dysconsciously adopt racist perspectives can perpetuate their erroneous perspectives with teacher candidates, even though the mentors may be committed to working with diverse populations (Cheruvu et al., 2015, p. 257).

Resistance by teacher educators

Teacher educators who are not specifically anti-racist educators may lack anti-racist perspectives or be unsupportive of equity efforts (Chapman, 2011; in Gist, 2017), resulting in the marginalization of equity courses, and the normalization of methods courses as core knowledge of the program. Additionally, teacher educators who lack anti-racist training focus instead on what has become known as “White privilege pedagogy”, which lacks adequate historical, social, and political context (Levine-Rasky, 2000a, p. 274). Lensmire et al. (2013) argue that, “to an amazing degree, the antiracist aspirations and responsibilities of White teacher educators have been concentrated in McIntosh’s discussion of White privilege,” (p. 411) via her infamous “Unpacking the invisible knapsack” article. Leonardo (2004) argues that teacher education should move past White privilege pedagogy, which asks White people to confess their privilege, and (at its worst) allows this confession to stand in for anti-racist action. Instead, teacher education programs need to move toward accountability for participation in unjust and White-dominant structures.

Racist discourses and ideologies

In addition to programmatic challenges, a significant challenge for anti-racist teacher educators are the racist discourses and ideologies that teacher candidates arrive to their teacher training programs with. These interrelated discourses include dysconscious racism (King, 1991), “color-evasiveness” (Bonilla-Silva, 2006), the myth of meritocracy (Schick and St. Denis, 2003), beliefs in the importance of neutrality and objectivity (Ladson-Billings and Tate, 1995), deficit discourses (Valencia, 2010), White saviorism (Cammarota, 2011), and false empathy (Warren and Hotchkins, 2015).

Dysconscious racism and lack of critical understandings of race

Teacher candidates lack racial consciousness, including a failure to recognize Whiteness as a racialized identity, and ignorance of their own racial positioning. King (1991) describes “dysconscious racism” as the process where White people tacitly or unknowingly accept dominant White norms and privileges, and do not think critically about racial inequity, aside from accepting “certain culturally sanctioned assumptions, myths, and beliefs that justify the social and economic advantages White people have as a result of subordinating diverse others” (p. 135).

Many teacher candidates are superficially aware of race but lack a critical understanding of race and racism, may lack an awareness of the pervasiveness of racism in educational systems, or are unable to understand race in historical context. This can include being unaware of the pervasiveness of racism in their own country (Solomon and Daniel, 2007), or a lack of socio-historical knowledge regarding the realities caused by race toward Indigenous Peoples in their region (Cherubini, 2011). A lack of socio-historical context for race also produces teachers that are unprepared to teach students of color due to a lack of training and knowledge of “theories of race, racism, and inequities that recognize the historical legacy of Whiteness as property” (Annamma, 2015, p. 310).

Color-evasive racism

Color-evasive discourses, formerly known as ‘color-blind’ discourses, are one of the most well-documented challenges in anti-racist teacher education (Bonilla-Silva, 2006, 2018; Ladson-Billings and Tate, 1995; Ledesma and Calderón, 2015). Color-evasive racism includes the assertion that teachers “don’t see color”, and therefore promote equal opportunity and reward individual merit and hard work (Ullucci and Battey, 2011). Color-evasive discourses ignore structural and institutional racism, and construct racism as having occurred only in the past. These discourses also position race as innate or biological rather than socially constructed, and make use of culturally-based stereotypes to justify racist beliefs about groups of people, which can lead to believing that racial inequality is natural, or “just the way things are” (Bonilla-Silva, 2006).

Teachers that hold color-evasive views focus on individual acts of racism rather than structural racism, and locate the problem of racism as belonging to the individual only. When students or parents try to point out structural racism, these claims are constructed as pulling the “race card” (McCreary, 2011). Teachers simultaneously displace the source of racism, by claiming it comes from the community or home, rather than from societal or school structures (McCreary, 2011). Some teachers are also afraid to discuss race and treat Whiteness as the assumed norm (Annamma, 2015), or claim that they will “treat all of their students the same”, in an effort to construct themselves as fair and non-discriminatory (Flintoff, 2018; Schick and St. Denis, 2003). Teacher candidates also may

believe that acknowledging the racial background of their students would make the candidates racist, and that they should focus on teaching their subject matter only, because race is irrelevant (Milner and Laughter, 2015).

Meritocracy and democratic racism

Meritocratic beliefs are closely linked to color-evasive racism. The ideological assumption behind meritocracy holds that “everyone has equal opportunity because we are all basically the same; all that is required to get ahead is hard work, talent, and effort” (Schick and St. Denis, 2003), which ignores the many ways that institutional racism counteracts individual efforts. Meritocratic and individualist discourses also assert that democratic institutions are neutral and fundamentally “fair”, and as such, will be able to mitigate all forms of oppression, including racism (Henry and Tator, 1994). A belief in the democratic values of justice and equality, while disavowing that educational systems have been designed to support White students, results in what has been called “democratic racism” (Henry and Tator, 1994).

Teacher candidates’ beliefs in meritocracy are grounded in entrenched ideas about individual merit and “liberalist notions of individualism” (Solomon et al., 2005, p. 153), asserting that racism resides in individual students and is not embedded in educational institutions (Wilson and Kumar, 2017). This belief then locates failure on the part of minoritized students as being an individual failure. In addition, even though teacher candidates locate the problem of racism in the individual, they resist individual self-implication by embodying a “removedness” from racism (Wilson and Kumar, 2017). Many teacher candidates, when asked to define social justice, also use language that suggests meritocratic beliefs, such as “treating everyone fairly” and references to equality (but not equity) (Bergen, 2020).

Deficit discourses

Deficit thinking is an additional long-held, racist, ideological discourse that locates school failure in the internal deficits or deficiencies of individual students (usually racially minoritized students and those of low-socioeconomic status), rather than looking at the systemic factors that produce school failure (Valencia, 2010, pp. 6–7). Perceived deficits such as limited intellectual abilities, linguistic ability, lack of motivation, and bad behavior are attributed to students’ genetics, culture, class, and familial socialization, rather than to the constructed superiority of the educator and school systems (Valencia, 2010, p. 7). These assumptions serve to blame the victim for their own failings, reinforce negative biases, result in low expectations of students, and create an additional form of oppression that morphs depending on the context (Valencia, 2010). For example, Dunne et al. (2018) found that various deficit discourses about students were prevalent among the majority of 250 White teacher candidates that they surveyed. Gebhard (2018), also found that teachers held low expectations specific to their First Nations, Métis, and Inuit students, and constructed these Indigenous students as a “problem”.

Teacher candidates of color are also constructed as having deficits by classmates and professors. Professors refer to additional language learner backgrounds as possible “barriers”, and teacher candidates of color felt that they needed to work twice as hard to prove their competence (Szecsi and Spillman, 2012, pp. 26–27). Teacher candidates of color also feel they need to defend against deficit, stereotypical beliefs held about them (Brown, 2014, p. 337), experienced low expectations from faculty, staff, and White peers (Brown, 2014, p. 334), and received negative reactions from parents about their accents (Szecsi and Spillman, 2012, p. 26).

White saviorism, false empathy, and uncritical allies

White saviorism and false empathy represent unique racist discursive challenges in teacher education. White saviorism, often grounded in narcissism or an elevated sense of self-importance, describes White teachers who understand themselves as caring or altruistic, while not experiencing or understanding the risks present in this perspective for their students of color (Matias, 2016). Other characteristics of White saviorism can include focusing on “saving” or “helping” students rather than transforming or addressing oppressive structures, avoiding understanding patterns of injustice (espousing a color-evasive view), not recognizing the need for collective action, and focusing on good deeds rather than underlying conditions of oppression (Cammarrata, 2011). White teacher candidates may assume a White savior position by expressing emotions such as care or love for their students, which in reality serve to mask hidden expressions of disgust for the Other (Matias and Zembylas, 2014). Similar rhetorics of “care” have also been shown to conceal deficit discourses, pathologize students, and construct teachers as victims (Toshalis, 2012).

False empathy or false generosity describes teachers who “think that they are building cross racial relationships with others, but fail to negotiate the terms of that relationship with the person they hope to be in relationship with, [and make] unsubstantiated assumptions about what that individual needs” (Warren and Hotchkins, 2015, p. 270). False empathy produces teachers who believe that they are allies, or possess more empathy than is confirmed by the supposed beneficiaries of their actions, but lead to “a failure to recognize, as a person with power and privilege, the multiple ways [they] subordinate others” (p. 269). Thompson (2008) describes this identity as the “lone White hero” self-construction, where teachers see themselves as the rare White person who “gets” it, and who contrasts themselves with less enlightened White people. Rather than examining their own complicity in racism, these teachers may engage in surveillance of others, burden Indigenous people and people of color with requests for affirmation, and demand that their own anti-racist activism be acknowledged rather than collaborating on collective and collegial responses to racism.

Teacher candidate resistance

“Good people”, emotionalities, and the maintenance of innocence

Teacher candidates do not want to be constructed as racist or “part of the problem” (Leonardo and Zembylas, 2013). Faced with anti-racist pedagogy, Schick (2000) found that teacher candidates’ “overwhelming desires for their productions of ‘good’ and

‘innocent’ identities ... is at odds with their desires not to know, with their will to ignorance” (p. 86), and that teacher candidates will employ various strategies to maintain this “goodness”, “innocence” and “respectability”. McIntyre (1997) terms these strategies “White talk”, which include “the infinite number of ways we manage to ‘talk ourselves out of’ being responsible for racism” and “serves to insulate White people from examining their/our individual and collective role(s) in the perpetuation of racism” (p. 45). Characteristics of White talk and moves to innocence include denials and defensiveness, evading or being unwilling to talk about racism, remaining silent or emotionally divesting from discussions about race and racism, distancing oneself from racist White people, and “colluding with each other in creating a ‘culture of niceness’” (p. 46).

Many of these strategies are the result of, or accompanied by, White emotionalities that manifest in different ways depending on the context. Typically these emotionalities show up when deconstructing race, racism, and bias. These can include feelings of distress, guilt, shame, discomfort, uncertainty, helplessness and self-victimization (Clark and Zygmunt, 2014; Matias, 2016). Of these, White guilt is particularly powerful (Matias et al., 2014), as it has immobilizing effects on teacher candidates. These emotions are also often given more space and attention than the emotionalities of BIPOC, and whose emotions teacher education programs cater to therefore becomes political (Matias, 2016).

The strategies that teacher candidates use to maintain the image of themselves as an innocent, good people are discussed individually next, but in practice these will often occur simultaneously. For example, Yu (2012) found that White teachers in a graduate level critical multicultural education class felt uncomfortable about engaging in race talk, responded defensively, and acted as though their credentials or teaching abilities were under attack. Their responses focused on claiming that they already knew “how” to teach, and that they had “love” for their students - strategies that serve to maintain their sense of goodness without examining their own complicity in perpetuating racism.

Denial and defensiveness

Teacher candidates’ denials can include disregarding or disbelieving evidence that indicates that White teachers show a preference for White students (Clark and Zygmunt, 2014), denials of White privilege or structural racism (Solomon et al., 2005), negating their White capital (Solomon et al., 2005), and denying “the role that Whiteness plays in shaping White educators’ lives” (Higgins et al., 2015, p. 251). White teacher candidates also display defensiveness (Solomon and Daniel, 2007; Yu, 2012), don’t feel that they should be responsible for incorporating Indigenous content into their teaching because they aren’t Indigenous (Higgins et al., 2015), don’t feel that as White people, it is “their place” to teach about race and racism (Bergen, 2020), or assume that they will be at primarily White schools, so learning about race was inapplicable to them (Nash, 2013). Some White teacher candidates may also use self-victimization as a way of turning the focus to how they have also been harmed by Whiteness (Matias, 2016).

Distancing strategies

Teacher candidates also seek to create distance between themselves and racism and the responsibility for addressing racism. For some, this might mean distancing themselves from overtly racist White people (Higgins et al., 2015; Schick, 2000), or constructing social distance from racism through time or place (Levine-Rasky, 2000b). Distancing strategies might also involve using a combination of silence and social disassociation in order to distance themselves from responsibility (Case and Hemmings, 2005), or being conflicted about their Whiteness and significant critiques of Whiteness (“White anxiety”) (Levine-Rasky, 2000b). Teacher candidates may also use “strategic ignorance” to distance themselves from the responsibility to meaningfully engage in critical education about treaties (Tupper, 2011), or perform helplessness in order to evade responsibility for figuring out anti-racist actions for themselves (Matias, 2016). In order to avoid feeling uncomfortable, teacher candidates may also try to shift conversations about race and racism to other axes of experience, such as gender or culture (Solomon et al., 2005), or to their subject area training, such as claims that teaching about racism takes away from teaching about literacy (Nash, 2013).

Strategic silence

Both teachers and teacher candidates will also use silence as an avoidance strategy. This can be exemplified by being unwilling to talk about race and racism (Gebhard, 2018), a desire to avoid being uncomfortable (Yu, 2012), withdrawing from meaningful conversations about race (Case and Hemmings, 2005; Dunne et al., 2018; Evans-Winters and Hoff, 2011) or emotionally disinvesting from these conversations (Matias et al., 2014), and not engaging in online discussions in order to resist learning information that challenges their worldviews (Lewis Grant et al., 2018). Teacher candidates also use silence or the omission of ideas by using phrases like “you know”, which enables them to make their views about race and racism known without having to feel uncomfortable by naming specifics. In this way, teacher candidates can maintain a sense of safety while expressing ideas they believe non-White groups may find problematic (Fasching-Varner, 2013).

Saying the “right thing”

Due to fears of being called racist, teacher candidates also use coded language, or want to know how to say the “right thing” when talking about race and racism. For example, teacher candidates wanted to be “equipped” with the ability to teach about race and were uncomfortable not knowing the “right” terminology or language to use (Dunne et al., 2018; Schick, 2000). Teacher candidates also use coded language in order to avoid using the wrong language, such as the use of “diversity discourses”: “while they often openly reject colorblindness, words like ‘urban’ and ‘inner-city’ stand in a coded language to signify racial categories without actually talking about race” (Mason, 2016, p. 1046). Bergen (2020) found that White teacher candidates also drew on these kinds of diversity discourse and other forms of “social justice” language in order to mask a lack of critical racial analysis. In part, this may be due to what Solomon et al. (2005) term “ideological incongruence”, where teacher candidates profess to be open to anti-racist education, but locate “the

problem of racism as a lack of knowledge about other cultures, thereby removing the need for an analysis of issues of power, dominance, historical colonization and oppression fostered primarily by Whites against other groups" (p. 158).

Compliance and disrespect

Finally, some teacher candidate resistance shows up in the form of compliance or outright disrespect for the course professors. Wilson and Kumar (2017), for example, found teacher candidates who were compliant in completing their equity course material because they knew they needed to pass the course. Similarly, teacher candidates can also perform "simulated tolerance" in class, but then use course evaluations to lash out against their course professors as a result of their discomfort with having to confront ideas about White supremacy (Evans-Winters and Hoff, 2011). Finally, some teacher candidates may also show outright and blatant disrespect toward their course professors and colleagues (Matias, 2016).

Anti-racist approaches in teacher education

Anti-racism in teacher education challenges the discourses and ideologies that reinforce Whiteness and racial discrimination in educational structures, including those that maintain other forms of discrimination, based on class, gender, sexuality, culture, and ability. Young (1995) positions anti-racist education as fundamentally different from other forms of education, as it requires an understanding that teaching is a political activity, rather than a vocational one (p. 61). Teacher candidates need anti-racist education to enable them to be agents of social justice so that all students can be school achievers. All teachers need to understand that schooling is a political activity, and that with knowledge of anti-racist education, they and their students can learn how and why they may participate in a more equitable society.

There are no universal approaches to anti-racism in teacher education. Seeking to identify and address multiple, context-specific racisms and forms of oppression will look differently depending on community location, program structure, professors, and students. In addition, some of the discourses and forms of resistance reviewed above can be more easily countered with knowledge-building and analysis than those that pose a fundamental threat to a teacher candidates' sense of self. Laughter (2011) asserts that White preservice teachers, in particular, may require a variety of approaches to engage in conversations about racism and anti-racism.

The next section outlines course-based and integrated or field-experience approaches to anti-racist education with teacher candidates (approaches to program reform are discussed in the recommendations section). Approaches are organized using an adapted form of Thomas' (1984) five conditions for anti-racist education. It is important to note that the boundaries between the categories overlap substantially, and that anti-racist education fundamentally requires a life-long commitment to un/learning and strategic action informed by Black, Indigenous, and people of color.

Creating safe spaces where injustice can be critically examined from multiple perspectives

Immersing teacher candidates in anti-racist literature does not adequately equip them to engage in the critical self-analytical reflection necessary for gaining anti-racist competencies (Cochran-Smith, 2000; Cheruvu et al., 2015; Yu, 2012). To become racially conscious and critically examine understandings of social difference and oppression, traditional lectures are insufficient, and teacher educators must call upon a variety of pedagogical practices to encourage active learning (Adams et al., 1997). White teacher candidates engaged in such reflection can challenge notions of their own White neutrality (Ullucci and Battey, 2011), ask critical questions about the process of their own racialization (Pollock, 2008), and develop an analysis of their intersectional identities and the consequent power-related implications (Schick and St. Denis, 2005).

Critical self-reflection, examination, and autobiography

Critical self-reflection can be initiated through storytelling and autobiography exercises (Bell, 2010; Yu, 2012), provided that they help teacher candidates connect these stories to structural thinking (Crowley and Smith, 2015). Schick and St. Denis (2005), for example, engaged teacher candidates in "rewriting" national and personal narratives regarding their social location based on various identities (race, gender, class), and to reflect on the ongoing implications of these identities within systems of power. Lund and Carr (2018) have found that engaging teacher candidates in identifying and explaining the context of experiences that have shaped who they are can provide inroads into talking about race and racism. Pollock (2008) describes using a similar approach that analyzes "opportunity denial", through asking critical questions about the racialized way that people have experienced the world, and describing what accounts for these differences. Pennington and Brock (2012) found autoethnography to be a useful tool to engage White students in moving beyond confessional tales, which assuage White guilt, toward developing the capacity to critically reflect on their own racial experiences in daily teaching practices.

Discomfort and processing emotions

White emotionalities outlined earlier, such as anger, shame, fear, guilt, and emotional distancing hinder teacher candidates from deeper emotional investment in anti-racism (Matias and Zembylas, 2014). The classroom can be a place where teacher candidates can reflect, process emotions, and work on overcoming deficit orientations and other racist discourses (Bialka, 2015). Teacher candidates who are actively engaged in a "pedagogy of discomfort" (Zembylas and Boler, 2002) are better positioned to understand their

personal investments in racism. A pedagogy of discomfort “requires that individuals step outside of their comfort zones and recognize what and how one has been taught to see (or not to see)” (Zembylas and Boler, 2002, p. 5). Through creating a space for discomfort while engaging in forms of critical self-examination, teacher candidates can begin to problematize “individual and collective emotions, histories, and sense of self” (p. 6). This process involves providing teacher candidates with “alternative affective investments on the basis of solidarity and social justice” (Leonardo and Zembylas 2013, p. 162), in order to cultivate race-conscious and aspirational anti-racist identities, and to help teacher candidates understand that this process is never finished, as it requires identifying and undoing the social, structural, and discursive reproductions of oneself.

Investigate the survival strategies of those with lived experiences of racism

Counter-narratives

Counter-narratives are stories that detail the experiences and perspectives of those who are historically oppressed, excluded, or silenced in educational settings. Reading, listening to, and being immersed in counter-narratives can help equity courses and teacher education programs validate the experiences and perspectives of Black, Indigenous, and people of color (Ullucci and Battey, 2011), and to (re)frame these sources of knowledge as valuable and necessary in classrooms and in the field (Cheruvu et al., 2015, p. 261). In addition, when a majority of teacher candidates are White, counter-narrative perspectives are valuable sources of knowledge, and tools that can disrupt, disturb, and challenge common hegemonic narratives (Cheruvu et al., 2015; Milner and Howard, 2013). Counter-narratives can be used in course readings and viewings, teaching materials, guest speakers, and immersive field experiences.

Perspective-taking and building empathy

Engaging teacher candidates in perspective-taking work, often through the use of counter-narratives, can build empathy and cultivate cultural humility (Warren, 2018). Empathy plays a significant role in preparing teacher candidates to understand their future students, and to build solidarity across race with their students of color (Ullucci and Battey, 2011). For example, DiAngelo and Sensoy (2014) found that using vignettes about minoritized people’s life experiences can allow teacher candidates to analyze situations, unsettle their expectations, and build understanding that can be drawn upon when they are being directly implicated in racism. The “through other eyes” approach developed by Andreotti and de Souza (2008) also includes perspective-taking, by allowing teacher candidates to imagine and encounter systems from other points of view, encouraging both empathy development and critical analysis, and endeavoring to cultivate ethical frameworks for engagement. In order to avoid charity-motivated responses in perspective-taking work, ensure that counter-narratives of Black, Indigenous, and people of color focus on stories of resistance and transformation, rather than stereotypical or “stock stories” (Bell, 2010).

Engaging those who experience racism and members of the dominant culture in examining how racism is resisted

Media literacy and analysis

In order to build critical understandings of how racism is resisted, Bennett et al. (2019) recommend doing media analysis, analysis of statistics, and other forms of research with teacher candidates to inform action opportunities (letter writing or advocacy campaigns, for example). Exercises can include engaging teacher candidates in discourse analysis and the use of anti-racist lenses with news stories, images, and commentary (Lund and Carr, 2018), which can allow them to more readily identify stereotypes, to see how racialized gender roles are reinforced, to understand how the media replicates racist narratives, and to connect these narratives to political parties (Housee, 2012).

Analyzing teaching materials

Racial literacy skills can also be developed through analyzing teaching materials for the “hidden curriculum”, which can include bias, stereotyping, and racism, among other forms of oppression (Tator and Henry, 1991). While stressing the importance of diverse representations in children’s literacy materials is clear (Martin and Spencer, 2020), diverse course materials do not necessarily lead to an anti-racist analysis, and it is important to train teacher candidates how to disrupt uncritical narratives in teaching materials (Beneke, 2017). For example, Mosley and Rogers (2011) engaged White teacher candidates with a framework that analyzed book characters for either passive or active racism or anti-racism, enabling them to identify which teaching materials were more actively anti-racist.

Conceptual frameworks and access to new language

Understandings of systemic racism can be stimulated by equipping teacher candidates with new frameworks to think through systemic problems (Bergen, 2020; Gillies, 2021). For example, teacher candidates who learn to apply a structural determinism conceptual framework are more able to understand racism as systemic. This framework includes looking at how discourses inform policies, practices, and laws, which then dictate outcomes, and subsequently feed back into discourses (Gillies, 2021). By applying this framework to different problems, teacher candidates can understand complex systems that were previously unknown or indescribable to them (Bergen, 2020).

Similarly, teacher candidates need access to new language in order to identify and name injustice. In Smith and Glenn (2019), for example, graduate education students did a two-part reflective assignment, where they wrote an initial reflection about their identity, and then re-visited this reflection at the end of the course using the lenses and frames they had since learned about,

including about power, difference, and cultural identity development. DiAngelo and Sensoy (2014) also use “silence breakers” to create constructive learning environments for White students, by equipping students with constructive phrases prior to discussions about race, so that they can articulate claims and questions in ways that open rather than shut down discussions. These can include “I have always heard that ... What is an anti-racist perspective on that?” or “I am having a ‘yeah but,’ moment, can you help me work through it?” (p. 194).

Facilitating skill development in order to resist oppressive conditions

Analysis of classrooms and schools

Bennett et al. (2019) found that much of the research with teacher candidates is idealist (focuses on changing individual beliefs) rather than realist (encouraging social action), and teacher education programs must try to bridge this gap. Investigations into one’s own classroom or school can have a sizable impact on how students understand their own capacity for identifying and challenging unjust structures (Pollock, 2008). In one course, teacher candidates were asked to observe the diversity of student identities and power dynamics (including racial and gender dynamics) in their practica classrooms, and to design lessons that would address the dynamics they had observed. During this process, teacher candidates reported being more committed to anti-oppressive approaches in their future teaching (Kelley and Brandes, 2010). Similarly, Pollock et al. (2010) found that teacher candidates who understood the tension between theory and action in anti-racist education were the most committed to serving students of color in their future classrooms. In order to have teacher candidates begin to understand racialized policies and structures in classrooms, Shah and Coles (2020) used a “racial noticing” module in a methods course, which included training students to notice racial identity and positionality, social interactions, and structural practices, artifacts, and norms.

Peer mentorship

Peer mentorship is an important component of anti-racist education for both White students and teacher candidates of color. Participation in collaborative social justice support groups, for example, results in new teachers becoming reflective in their journey, and strengthens commitments to teaching and social justice (Picower, 2011). Peer groups can also be structured as professional learning communities that include partners in teacher education, mentor teachers, and teacher candidates that are committed to disrupting Whiteness in their teaching (Little, 2002 as cited in Wetzel, 2020). Extra-curricular fellowship models that combine peer learning with teacher-community inquiry meetings also help teacher candidates develop racial literacies (Solic and Riley, 2019), and practices of “critical friendship” can provide structure and support for White teacher candidates who are working to develop anti-racist frameworks. The need for peer affinity spaces for teachers of color, in particular, is discussed in the recommendations section.

Challenging racism in all its forms through informed collective action

Participatory action research

Engaging in action research with teacher candidates provides them with experience in ways to challenge injustices in their future teaching. The action research by Anderson et al. (2015) worked with teacher candidates to interrogate the sites of learning about social and environmental justice issues in their own program. The process of this project led candidates to consider issues of power and privilege, and to brainstorm solutions together that could be implemented in the following years. This process highlighted that it is necessary for pedagogy to engage both the intellect of students and their emotions. Butler et al. (2017) describe how White teacher candidates were tasked with learning from urban high school students, through a student voice project, by inquiring about students’ learning experiences, and asking what advice they had for teacher candidates. The authors found that, over the course of the year, teacher candidates cultivated deeper relationships with students than those that would normally be constrained by a typical practicum placement. Teacher candidates learned about the positive place-based associations that students had with their school, and this in turn allowed the teacher candidates to develop deeper understandings of themselves and their students.

Service learning and social action curriculum projects

Service learning and social action curriculum projects (SACP) that give teacher candidates the responsibility of defining the “problem” through a critical pedagogical lens can engage them in interrogating their own beliefs (Ponder and Veldt, 2011; Shultz and Baricovich, 2010; Stenhouse and Jarrett, 2012). Stenhouse and Jarrett’s (2012) Problem Solutions Project and Shultz and Baricovich’s (2010) SACP’s saw teacher candidates identify problems as a group, brainstorm solutions, implement action, and write reflections on the process. Projects ranged from a lack of resources and books in elementary schools to hunger rates faced by teacher candidates’ in their own communities. Stenhouse and Jarrett’s (2012) findings revealed that teacher candidates felt a sense of empowerment as a result of being engaged in issues that affected their own realities.

Similar to SACP’s, Ponder and Veldt (2011) revealed that asking teachers to implement service-learning projects in their classrooms enabled them to effectively foster a democratic classroom environment where student-led initiatives could be facilitated, to make connections and build partnerships with communities outside of the classroom, and to reflect on their own growth throughout the process. Field experiences in communities of color can also build capacity for naming racist educational practices and developing a race-conscious repertoire (Ullucci and Battey, 2011; Waddell, 2011), provided that these cultural immersion experiences are designed in conjunction with the communities they serve.

Summary and recommendations

The sections above describe practices and strategies that have been shown to increase racial literacy, racial consciousness, and commitments to anti-oppression on the part of teacher candidates. These goals are achieved through being specific about identifying and disrupting problematic racist discourses, including dysconscious racism, color-evasive racism, meritocracy, deficit thinking, and White saviorism or uncritical allyship. An important component of this process is challenging White teacher neutrality by racializing and dissecting Whiteness, and naming racist educational practices and policies (Ullucci and Battey, 2011). In addition, preparing for resistance from teacher candidates and strong emotional reactions should be built into these processes.

The good practices identified use strategies that allow for critical self-evaluation, and immersion in counter-narratives, to equip teacher candidates with new conceptual frameworks and the ability to identify and name injustices. Without these new frameworks, teacher education programs run the risk of producing students who are confident that they can be anti-racist educators, even though they may lack an accompanying understanding and analysis or continue to hold individualistic views about racism (Bergen, 2020). Importantly, teacher educators must ensure that their courses and materials are being created to validate the experiences and perspectives of Black, Indigenous, and teacher candidates of color (Ullucci and Battey, 2011). Lastly, teacher educators must also work to intentionally equip teacher candidates with skills to challenge and change oppressive structures and not just their beliefs.

Recommendations for teacher training policy and practice

Prioritize Black, Indigenous, and teacher candidates of color

Teacher training must prioritize the recruitment and retention of Black, Indigenous, and teacher candidates of color, and must also ensure that their knowledge and experiences are valued in teacher training (Brown, 2014), by recognizing that teacher training does not occur in a race-neutral context, and by supporting and validating collectivism and collaboration. In part, this can be done by creating race affinity spaces, as “involvement in such networks can be seen as an important factor in a successful teacher education experience, both socially and professionally” (Cheruvu et al., 2015, p. 250). Kohli (2019) recommends that these affinity spaces be legitimized with course credit, as teacher candidates of color may need a reprieve from being minoritized (Kohli, 2019) and an opportunity to do collaborative group work with their own racialized cohort (Tileston and Darling, 2008 in Szecsi and Spillman, 2012, p. 27). Learning with other minority students has also served as a “comfort zone” in otherwise White-dominated spaces (Szecsi and Spillman, 2012, p. 27).

Meaningful engagement with the experiential knowledge of teacher candidates of color serves to recognize them as both learners and experts with unique insights (Pham, 2018). Teacher education can honor the life experiences of students of color while not assuming that they may always recognize or understand how racism manifests in their own experiences (Brown, 2014, p. 336). In order to do this, programs must offer engagement with critical theory and BIPOC theorists (Kohli, 2019), and explicitly equip teacher candidates of color with strategies for understanding the double standards that they will experience in education and as teachers (Gist, 2017, p. 947).

Hire and train anti-racist teacher educators

Many authors have highlighted the necessity of problematizing the racial demography of teacher educators (Milner and Howard, 2013, p. 550), and of increasing the number of BIPOC university faculty, supervisors, and mentor teachers (Cheruvu et al., 2015; Szecsi and Spillman, 2012). Without faculty diversity, the cultural and linguistic diversity of the program structure is at risk (Gist, 2017). Teacher candidates of color often cite a lack of diversity among teacher educators as evidence of their program’s lack of commitment to culturally responsive pedagogy (Jackson, 2015, p. 232). Teacher candidates also appreciate mentors who are minority teachers (Szecsi and Spillman, 2012, p. 27), and value mentor teachers who were from the same community as their students (Pham, 2018). To be effective, both graduate and undergraduate programs should ensure that existing faculty recognize, support, and practice anti-racist teaching.

Scaffolded equity courses and collective learning

Often, equity or foundations courses are expected to cover all the facets of social injustice in a single course (Milner and Howard, 2013). Program claims of infusing these topics throughout a program are often unfounded or exaggerated (Milner and Howard, 2013, p. 553), and seldom do programs include social justice or anti-racist materials in methods courses other than English language arts or social studies (Jackson, 2015, p. 230). In addition, Brown (2014) asserts that “developing teachers that both hold a pedagogic commitment and understand how to effectively enact such socially just and relevant teaching in the classroom takes deliberate, targeted training” (p. 340), and many have argued that teacher education programs need to emphasize a deeper study of race across all courses (Milner and Laughter, 2015).

Scaffolding equity courses throughout a program, similar to the scaffolded nature of many subject area methods courses, can encourage teacher candidates to build their content knowledge and skills over multiple semesters and years, while building relationships with mentors in these areas. Courses that merge equity content and methods, such as “content-agnostic methods course focused on race at the classroom level” (Shah and Coles, 2020, p. 597) can also disrupt the theory/methods dichotomy in

many programs. Finally, Solic and Riley (2019) recommend that teacher education programs should cultivate multidimensional opportunities beyond classroom walls, such as the peer mentorship models discussed earlier, in order to better develop racial literacies.

Introduction

Teaching Performance Assessments (TPAs) have been part of the initial teacher educational landscape for more than 20 years (Stacey et al., 2020). TPAs are final, summative, portfolio tasks that assemble evidence of the pre-service teachers' ability to plan, enact and reflect on the complexity of teaching for diverse learners. In this way, they are intended to be authentic assessments of teaching (Darling-Hammond and Snyder, 2000; Gallant and Mayer, 2012) and take place in the context of practice. While a final assessment of teaching and a teacher's capacity and "readiness" (Buchanan and Schuck, 2016; Darling-Hammond, 2012a,b) to graduate and enter the classroom is arguably a feature of all pre-service teacher programs, TPAs are generally understood to have a capstone function; this means they are designed as the culmination of pre-service teachers' knowledge and practice gained throughout the Initial Teacher Education (ITE) program they have undertaken. While all ITE program arguably have final teaching assessments, when discussion of TPAs occurs in public and educational discourses, what is generally being referred to are assessment instruments that are common to more than one institution, and that involve moderation and benchmarking practices beyond an individual Initial Teacher Education program. TPAs are considered "high stakes" because teaching graduates' access to professional licensure (e.g., United States of America) or provisional registration (e.g., Australia) is dependent on successful completion of this portfolio task. Drawing on international research and examples, this chapter will explore: the policy context and genesis of Teaching Performance Assessments (TPAs); the key components of the assessment instruments; and issues and challenges for the implementation and research associated with TPAs. The chapter will conclude with considerations for TPA research and practice going forward.

The policy context of TPAs in Initial Teacher Education programs

It has been well documented that international governmental concern with educational outcomes for students and, relatedly, the quality of teaching and learning in schools, has led to decades of reviews into the impact and efficacy of Initial Teacher Educations (ITE) programs (Dinham, 2013; McLean Davies et al., 2017). Indeed, many articles about Initial Teacher Education begin by acknowledging, like this one, that this is an enthusiastically reviewed and increasingly regulated space (Louden, 2008; Mayer, 2014). A key outcome of these reviews has been to introduce Teacher Professional Standards in various national contexts, which are designed to ensure that teachers have the necessary knowledge, skills, and dispositions for impactful teaching as they enter the profession and then progress through their careers. As might be anticipated, there is much scholarly literature on the standards-based reform of teacher education (for example, Allard and Doecke, 2014; Cochran-Smith, 2006; Wyatt-Smith et al., 2017). Teacher education researchers have alternatively welcomed (Shaukat and Chowdhury, 2021) and raised concerns (Allard and Doecke, 2014; Tuinamuna, 2011) about the ways Professional Standards have been developed and implemented within national contexts.

In the US, high-profile teacher education researchers, such as Linda Darling-Hammond, have been integral to educational reforms and have championed the informed use of standards as a means of raising the status of the profession; supporting the

quality of learning for diverse students in different contexts and ensuring transparency and consistency of practice that is common in other professional contexts (Darling-Hammond, 2004, 2015). From an accountability perspective, the development of Standards can also be understood as a response to concerns that the field of Initial Teacher Education is unregulated, parochial, and opaque (Darling-Hammond et al., 2014). In this light, the implementation of Standards has also been critiqued as reducing the complexity of teaching, ignoring, or flattening the disciplinary and contextual nature of teaching; homogenizing teaching and learning (Mills and Goos, 2017) and potentially devaluing teacher judgment (Mayer, 2021).

TPAs are closely linked with the introduction of Standards (AITSL, 2018), and therefore can be understood in the context of a global education reform agenda (Mayer, 2021), and what Stahlberg has labeled the Global Education Reform Movement (GERM) (Sahlberg, 2011), which emphasizes the importance of teachers to student learning and achievement (Hattie, 2012; OECD, 2005, 2009; Wenglinsky, 2002). The link between the development of Teacher Professional Standards and TPAs can be observed in the United States (Darling-Hammond, 2012c); Malaysia (Gallant and Mayer, 2012); and the Australian context (Kriewaldt, 2012; Wyatt-Smith et al., 2017) (see Table 1 below). However, while Teaching Standards are produced by Government agencies and/or education departments (depending on the national context), Teaching Performance Portfolio Assessments are not generally or exclusively determined by governments, but rather are often produced by consortia of Universities or Teaching Colleges, sometimes in collaboration with government (as in the case with Australia—see Kriewaldt, 2021), or industry (as in the case of the EdTPA, Sato, 2014).

Indeed, the development of TPAs across the globe offers evidence of Teacher Education researchers, scholars and leaders responding to in the context of Standards-based reforms by taking responsibility for the ways in which teaching will be ultimately assessed, and relevant national Standards enacted in Initial Teacher Education Programs. This was initially the case with the TPAs in California, where Darling Hammond and the team at Stanford played a key role (Darling-Hammond et al., 2013); in Australia where two consortia consisting of universities developed and piloted TPAs in 2017 (see Buckworth et al., 2018; Kriewaldt et al., 2021; Wyatt Smith et al., 2017), and in Malaysia where a TPA was co-developed with between Malaysian and Australian teacher educators (see Gallant and Mayer, 2012).

Perspectives on Teaching Performance Assessments

Given that TPAs are, in policy terms, aligned with the GERM movement, these high-stakes assessments can be understood as a material effort to regulate a profession that governments contend has relied on anecdotal evidence rather than systematically gathered data to inform decision-making (Cochran-Smith et al., 2013; Gallant and Mayer, 2012). Scholars have also noted that the emphasis on the assessment of the “impact” of pre-service teachers more generally on student learning, and government intervention in this regard, makes the educational problem teachers, and directs attention away from the complexity of education systems and the range of actors who influence student learning (Ell et al., 2019); contributing to what Power has called “audit culture” (Power, 1997), and Ball the “technology of performativity” in education (Ball, 2003). For some, the US edTPA, which is now owned and administered by the multi-national company Pearson, exemplifies these issues with externally and commercially driven Standards-based reform and has thus drawn significant criticism (Choppin and Meuwissen, 2017; Greenblatt and O’Hara, 2015; Hutt et al., 2018; Tuck and Gorlewski, 2016).

Yet, although TPAs are identified as being part of neo-liberal reform, teacher education researchers who have chosen to work with or alongside government and industry to development these assessments have argued that TPAs have significant value, as

Table 1 Examples of interconnections between the development of Teacher Professional Standards and Teacher Performance Assessments.

Country/state	Introduction of standards	Introduction and development of TPA/s
California, North America	Teacher standards for California were developed in 2007 Common Core State Standards (CCSS) adopted in 45 states in 2010.	Since 2008 4x TPAs have been utilized to assess California’s teaching performance expectations Fresno Assessment of Student Teachers (FAST); Performance Assessment for Californian Teachers (PACT), the nationally available edTPA; and the Californian Teaching Performance Assessment (CalTPA).
Malaysia	Teacher standards—2009	Malaysian TPA developed in 2009 and used in three Malaysian teacher training institutes (Gallant and Mayer, 2012)
Australia	2009—work begins on teacher standards. Teacher Professional Standards (teaching and program) introduced in 2011	Program standards revised in 2015 (to include TPA requirement—AITSL, 2015, p. 12) following a Ministerial review of initial teacher education (TEMAG, 2015). Two TPAs were initially developed for national use. The Graduate Teacher Performance Assessment (GTPA) in 2015 and: the Assessment for Graduate Teaching (AfGT, 2018) in 2016 (see summary report 2018).

they authentically capture the work of teachers (Darling-Hammond, 2012a,b) keep responsibility for teaching assessment within the profession—thus arresting the take-over of teaching by external stakeholders (Buchanan et al., 2020)—and provide evidence of how Initial Teacher Education Programs are preparing pre-service teachers to support the learning of diverse students (Darling-Hammond, 2015; Gallant and Mayer, 2012). Indeed, Bourke and others contend that although TPAs are sometimes viewed as a “compliance mechanism” (p. 40) these assessments “would be better understood as an opportunity for assessment innovation, improvement, and effective change” (Bourke, 2019, p. 40; see also Guskey, 2002; Supovitz and Taylor, 2005). To this point, Darling-Hammond has pointed out that when TPAs were developed in California, they replaced mandatory, multiple choice tests which were bespoke across North America. Darling-Hammond argues, following the policy analysis of Edward Crowe, that these multiple-choice tests had no intentional consistency; did not use evidence of practice; and often assessed teacher knowledge prior to entering their Initial Teacher Education Program (Darling-Hammond, 2010). Following the introduction of TPAs in the US context, then, Darling-Hammond asserts that the expectations of pre-service teachers’ assessment are now better aligned with those of in-service teachers/accomplished teachers in the US context, who also seek US National Board Certification via portfolio assessment which included video and lesson plans (rather than a summative test).

Like others who affirm the role and place of TPAs within pre-service programs (Caughlan and Jiang, 2014; Wei and Pecheone, 2010), Darling-Hammond also draws attention to the ways in which these assessments enable pre-service teachers to meaningfully reflect on and integrate theory and practice, and argues that data from these portfolio assessments can be utilized to

both reflect and predict teachers’ success with children so that they can not only inform personnel decisions, but also leverage improvements in preparation, mentoring, and professional development.

Darling-Hammond (2010, p. 1).

Further, those involved in designing and implementing TPAs similarly contend that these assessments, which include multiple components, are better able (than other forms of teacher practice assessment, such as summative tests) to reflect the complexity of teaching, of student learning, and importantly, of teacher judgment and decision making, which is understood as key to teachers’ work and professional development (Kriewaldt, 2012; Ravitch, 2010). In this way TPAs gather more authentic and contextual evidence of teaching and learning that can’t be captured by students’ standardized test scores (Darling-Hammond and Snyder, 2000; Tang, 2008), and usefully inform decisions, planning and assessment when pre-service teachers undertake practicum experience (Gallant and Mayer, 2012).

While reviews of Teacher Education have contributed to the “policy borrowing” (Steiner-Khamsi, 2004) across the globe, of TPAs the movement and influence of significant researchers in the field of Teacher Education have also contributed to the development of TPAs across the globe, and to “policy traveling” across diverse national contexts (Alexiadou and Jones, 2001, p. 2). For example, Professor Diane Mayer (originally from Australia) was involved in the development of PACT; the Malaysian TPA, and the Australian Assessment for Graduate Teaching (AfGT), and a TPA developed for use at Deakin University, also in the Australian context. Mayer’s commitment to TPAs as authentic assessments (Gallant and Mayer, 2012), is evident across these instruments. There are also established links within the US context regarding the development of TPAs. Hébert (2017) notes that high-profile teacher educators and researchers Percheone, Wei and Darling-Hammond all have had key roles in developing the Performance Assessment for Californian Teachers (PACT) and the national edTPA.

The common design components of TPAs

Korthagen and Vasalos note that it is challenging “to make contact with the core qualities which are of importance at that particular moment” (Korthagen and Vasalos, 2005, p. 68) when making decisions about student learning in the context of teaching, and thus a range of assessment components or elements are generally considered necessary in order for TPAs to authentically capture the complex work of teachers as they support student learning. As one might expect, however, there are commonalities among TPA components, as teacher educators and scholars have worked through issues of what should be collected as “evidence” of sound teaching preparation and performance, and how pre-service teachers will be best be supported to meaningfully analyze and reflect on their practice in different national contexts. In their systematic review of international research literature pertaining to Teaching Performance Assessment, Stacey et al. identify that in order to capture the work and complexity of teaching authentically, TPAs commonly reflect the learning and teaching cycle (Stacey et al., 2020) and include: planning and preparation documents and evidence of student learning in context—which often include critical observations of classroom practice (undertaken by a third party, such as a mentor teacher), or facilitated through video recording; samples of student work; and summative assessment data (Stacey et al., 2020, pp. 512–513). Throughout these core components, two integrated aspects of reflection are undertaken: pre-service teachers reflect on student learning, and on their own practices that have supported (or perhaps limited) learning. This capacity for profession reflection is identified as core to TPA models (Gallant and Mayer, 2012; Kriewaldt et al., 2021), and thus aligns TPAs with practitioner research and inquiry approaches and commitments (Cochran-Smith and Lytle, 2009). In this section, we will briefly outline what can be discerned as the common components of TPAs, noting the rationale for the inclusion of each component, and any challenges or considerations related to its use.

Lesson plans and key instructional resources and materials

Lesson preparation and planning is core and the most common component of TPAs (Darling-Hammond, 2012a,b). TPAs generally require PSTs to submit not only a sequence of lesson plans but a range of multimodal resources and materials that support the lesson plans, for example, reading materials, graphic organizers, slides, and supporting documents. Lesson plans and supporting materials offer evidentiary insight into what PSTs want their students to understand and develop in their learning sequence. This component is designed to capture the thinking processes of PSTs and their knowledge of content-specific pedagogy through written reflections, commentary and feedback on planned classroom tasks and the selection and developmentally appropriate content and pedagogy. In addition, some TPAs, such as the CalTPA requires the submission of a written narrative: *Getting to Know Your Students*. Here contextual information about students' assets and needs supports the rationale for developing lesson plans.

Attention has been drawn to the tensions around the time commitment and manageability of "labor-intensive" (Ginsberg and Kingston, 2014, p. 40) texts to support the content materials and resources. Sato (2014) raises another concern that PSTs may be tempted "to make compromises" about what they include in this component to meet the demands of the assessment task. TPA models like the AfGT and the CalTPA have attempted to ameliorate the labor-intensive demands of this component by including response templates.

Videos

Collecting segments of video evidence that records teaching practice offers an effective way for PSTs to review and reflect on teaching performance (for example for the edTPA see Jackson et al., 2018; Noel, 2014; for PACT see Okhremtchouk et al., 2009; and for the AfGT see Kriewaldt et al., 2021). As effective feedback can play a powerful and pivotal role in learning (Hattie and Timperley, 2007; Sadler, 1989), TPAs often require documented feedback from mentor teachers on PST teaching performance. PSTs are encouraged to provide a rationale to justify the recorded teaching moments along with the evaluation criteria, and a summary of student performance (Kriewaldt et al., 2021). Sato (2014) and others has raised concerns that video recording in classrooms have the potential to be problematic in terms of privacy and made complex by the logistics of arranging for someone else to film while the PST delivers the lesson. These issues must be negotiated with the school. Aligning with the Australian Institute of Teaching and School Leadership requirement for Australian TPAs (AITSL), and mindful of concerns around video, the GPTA does not limit the range of ways to "show" teaching practice by stipulating the use of video recording. Alternative ways to demonstrate the current range of teaching performance by a PST can be articulated when completing the GTPA, through deep reflection and observation notes with embedded images (Wyatt-Smith et al., 2020).

Work samples from three (3) students

The collection and analysis of student work is an opportunity to evidence student learning. It is common for TPAs to require PSTs to conduct an "an in-depth analysis of the work of several individual students" (Bunch et al., 2009, p. 106). A comprehensive response to this task reveals to the assessors not only the PST's knowledge and skills associated with creating appropriate assessments but, crucially the thinking processes to analyze and evaluate evidence of student learning. To support PSTs, the CalTPA model provides a template to prompt reflection on how successful the PSTs thought they were in preparing relevant and rigorous content-specific lessons for their focus students (see for example in CalTPA [2018] sample template to prompt reflection on what was learned (https://www.csusm.edu/soe/currentstudents/caltpa_c1_guide_ss.pdf)).

Whole class assessment

As part of their professional preparation, it is important that PSTs develop the ability to analyze whole class or summative assessment data, and this therefore also a common feature of TPAs. The focus of this component is often on the collection, analysis, and evaluation of aggregated assessment data. Reviews of TPA models commonly point to this component as the most challenging aspect of TPAs due to the complex and exacting language and data literacy demands facing PSTs as they engage with this data and explicate their results and findings (Kim, 2019). While challenging, the experience for PSTs is often described as informative and fulfilling and TPA templates are used to prompt and guide PSTs through aspect of the task so that they might more deeply engage with the relationship between whole class data and their teaching practices (Kriewaldt et al., 2021).

Other general characteristics, processes and practices associated with TPAs

Collaboration is a key feature of both the design and implementation of TPAs. As the intention of TPAs is to provide a common assessment of teaching performance that is both relevant to individual teaching contexts, and able to be implemented across diverse contexts, collaboration is required at each stage of TPA design, implementation, and assessment phases. This is often complex and political work, requiring Teacher Educators to broker relationships across institutions, governments, principals and teachers, and education unions, and can result in large consortia of interested parties being established for the purposes of developing the TPA.

In the American context, the Performance Assessment for Californian Teachers (PACT) offers a strong example of collaborative design. PACT was created by a consortium of teacher preparation programs including "30 universities, 1 district internship program, and 1 charter school network" (SCALE) and was led by the Stanford Center for Assessment, Learning and Equity (SCALE). The national EdTPA, drew on PACT (Hébert, 2017) in its early development, and some have referred to it as the "second-generation" PACT (Falk, 2013, p. 1) and like other TPAs, was also developed through a partnership between a university, the Stanford Center for Assessment, Learning and Equity [SCALE], and the American Association of Colleges for Teacher Education (AACTE) (Hébert, 2017;

Wyatt-Smith et al., 2022). Collaboration between institutions is necessary if a TPA is to be genuinely appropriate across contexts, and able to be taken to scale.

Developed some 10 years after PACT, in the Australian context, the AfGT, piloted in 2017, was designed by an initial consortium of 10 Universities nationally. The establishment of the consortium was catalyzed by the Australian Institute for Teaching and School Leaders' invitation to consortia of ITE providers to collectively bid for modest funding to design a TPA that would suit the diverse geographical and social ITE contexts. As well as being designed for diverse geographical and social contexts, the AfGT was designed for pre-service teachers preparing for careers in primary or secondary settings, and in programs delivered face-to-face, online or a mixture of these modes. Clear structures to enable collaborative design, and the input of all teacher educators who would be implementing the TPA (whatever the size of their pre-service teacher cohort), enabled all stakeholders to feel ownership of the process and the assessment instrument being developed (Kriewaldt et al., 2021).

Writing about the introduction of a TPA in the Malaysian context, Gallant and Mayer report that collaboration was evident in the ways in which the range of teacher educators involved in the design of the assessment instrument co-designed and tested the rubrics intended to be used to assess the TPA.

Malaysian educators worked together as a group to refine the TPA rubrics to ensure that they not only judged the work in relation to the Malaysian teacher standards but also reflected the cultural contexts within which the pre-service teachers would work.

Gallant and Mayer (2012, p. 298).

Further, the Malaysian TPA served, like other assessment tasks which are enacted in practice (see for example Kameniar et al., 2017) to serve as a connecting bridge between all stakeholders—student, mentors, or supervising teachers—who were charged with the responsibility of supporting the professional development of the pre-service teachers. Gallant and Mayer note that the Malaysian TPA impacted on professional learning in school contexts, and improved relationships between lecturers, pre-service teachers, and classroom mentors/supervisors (Gallant and Mayer, 2012, pp. 302–3).

TPA differences and distinctions

A range of components and cycles/processes are used

As indicated in Table 2 above, TPAs use some common components, but these are not standardized, mandated, or expected across instruments within or across national contexts. In some TPAs, such as the edTPA, emphasis is placed on detailed reflective

Table 2 Summary of the common TPA components.

<i>Common TPA components</i>	<i>Focus</i>	<i>Examples of TPAs with common component</i>
Planning for teaching and learning Lesson plans Supporting - Reading materials - Graphic organizers - Slides - Content supporting documents Commentary notes Rationale/justifications Supervising teacher notes	Pedagogical content knowledge and skills	California Teacher Performance Assessment (CalTPA) Assessment for Graduate Teaching (AfGT) Graduate Teacher Performance Assessment (GTPA) Education Teacher Performance Assessment (EdTPA) Performance Assessment of California Teachers (PACT)
Observation Video and audio recording Still images Annotations Reflections Mentor teacher's written feedback on video segments	Teaching performance	CalTPA AfGT GTPA (video data optional) PACT EdTPA
Selected Student work samples Collect and analyze work examples from three (3) students that demonstrate a range of achievement. Cognitive commentaries on students' work	Evidence of individual student learning during and after lesson sequence	CalTPA AfGT GTPA edTPA
Analysis of whole class assessment data	Evidence of whole class learning before and after lesson sequence	Cal TPA AfGT GTPA edTPA

commentary which accompanies the pre-service teachers' gathered evidence of planning for learning, teaching and then assessing student learning (Hébert, 2017; SCALE, 2021). Other TPAs, such as the AfGT, include elements such as a situational analysis, which provides pre-service teachers with scenarios in a component called "expanding practice" and requires them to articulate their professional judgment and reasoning in contexts they may not encounter in the course of their practicum experience (Kriewaldt et al., 2021).

While many TPAs use video, as noted above, this is optional in some TPAs (such as the Australian GTA), and the duration of the cycle and structure of the assessment itself depends on the context of the TPA. Although the CalTPA includes two cycles with a focus on content-specific instruction and then assessment (Ervin-Kassab et al., 2021), the Australian GTA and AfGT instruments conceive the assessment in terms of one cycle which includes all elements of planning, teaching, assessing, evaluating, and reflecting. Finally, TPAs have varying degrees of weight within a program. In some programs, TPAs act as the total final assessment of a PST's "readiness for practice," while in other cases, PSTs must also pass their supervising teacher/mentor teacher's individual assessment of their teaching performance, (which is the case for those PSTs undertaking the AfGT <https://education.unimelb.edu.au/research/projects/assessment-for-graduate-teaching-afgt>).

Moderation and assessment processes are bespoke and contextual

While all TPAs involve some form of external moderation, the nature of this varies across national contexts. In the case of PACT, two major dimensions are assessed: the Embedded Signature Strategies which are intended to be formative and are determined by individual institutions, and the Teaching Event/s which are assessed by discipline experts and who are trained to use bespoke assessment rubrics (Hébert, 2017; Wei and Pecheone, 2010). Hébert notes that a major distinction between PACT and edTPA pertains to scoring of materials. While PACT assessors are active in the consortium, assessors for the edTPA consist of current or retired educators who both "have content-specific expertise in the content area [they] are applying to score" and "have worked with or mentored teacher candidates or beginning teachers within the last 5 years" (Pearson Technology, n.d., para. 3 cited in Hébert, 2017, p. 76.) While it has been argued that the physical and contextual differences between assessors and the pre-service teachers producing the edTPA will ensure a robustness of the assessment instrument, and enable the edTPA to be genuinely national (Pearson Education, 2011), some scholars are concerned that this will mean that assessors miss important contextual information about programs and school communities, and that the separation between assessors and those preparing pre-service teachers to undertake the edTPA will impact on the integration of the assessment in the program (Hébert, 2017). In the case of the Australian AfGT, a much smaller TPA, assessment is undertaken locally, by trained assessors connected with the relevant programs, and then these assessments are benchmarked and moderated across the consortium, a process which leads to the refinement of the instrument itself (Kriewaldt et al., 2021; Buckworth et al., 2018).

The focus and nature of the TPA credential

The focus and credentialing offered by the TPA is different, depending on its national context. While the Australian and Malaysian TPAs are designed for general application, and utilized in disciplinary contexts, the North American TPAs assess the suitability of pre-service teacher to be considered "ready for practice" in a particular disciplinary or learning contexts, such as mathematics or English Language, or special education. For example, PACT has been "customized to seventeen different credential areas" (Pecheone and Chung, 2006).

Issues and challenges for TPAs and TPA research

There are a range of challenges facing those assembling consortia and designing, implementing, assessing, and then researching the efficacy of TPAs. One of the main intentions of TPAs is to support pre-service teachers to focus on student learning, and the teaching that supports this, rather than making the *teacher* the unit of analysis. However, Gallant and Mayer note, regarding the Malaysian TPA, that there was a danger of pre-service teachers concentrating on themselves, rather than on student learning:

One key finding from this study is that when pre-service teachers perceived the TPA as explicit documentation of teacher performance, considerations about student learning became peripheral. Data indicated that when pre-service teachers speak only about themselves and their teaching, they essentially separate the teaching act from considerations of student learning. This is worrying since the explicit purpose of the TPA was to assess teacher performance specifically related to student learning and the associated professional decision making (p. 304).

This research highlights the challenge of maintaining the intention of TPAs when the outcome of the assessment will determine the pre-service teacher's entry into the profession. It also draws attention to the challenges of "authenticity" presented by these assessments. Indeed, it might be anticipated that pre-service teachers will not successfully enhance student learning (or at least for all their target students) in a given context, over a series of lessons. While it is "authentic" for this to occur, and appropriate for pre-service teachers to learn and reflect on the complex circumstances that have contributed to this limited student progress in the target area (some of which are likely outside their control), this authenticity may sit in tension with the purpose of TPAs, which is to assess whether or not pre-service teachers are meeting national or state standards (a purpose which requires the

pre-service teacher to demonstrate successful and measurable student learning). So, it is understandably difficult for pre-service teachers to not be “distracted” by the personally and professionally high-stakes nature of the task they are undertaking.

Another challenge relates to the nature of the portfolio assessment itself. It has been argued that TPAs, even those which require use of classroom video as evidence, can be manipulated post the classroom events captured to produce a desirable outcome for the pre-service teacher (Marsh et al., 2010). For this reason, Evans (2011) has suggested that it would be valuable for TPAs to include an oral component, which he recommends would give teacher candidates the opportunity to display knowledge and skills demonstrating three components of professionalism “behavioral, intellectual and attitudinal” (Evans, 2014, p. 189), and to engage in dialog about their practice. Yet, while small institutions may be able to include an oral component in their TPA, this would be difficult to take to scale, and would produce further challenge for efficient cross-institutional moderation practices.

Further and more general challenge regarding the implementation of TPAs is bought about by consistency and resourcing. Despite the intention for TPAs to be relevant across contexts, and robustly moderated and assessed, as we have noted, a range of TPAs and assessment practices exist within national and state contexts in different geographical jurisdictions. While the intention of governments and regulators appears to be for TPAs to be robust and relevant, and an appropriate assessment of standards (DeLuca and Bellara, 2013), with the assessment undertaken by pre-service teachers able to be validated and measured, and applicable across a range of contexts, this requires significant resourcing and support, and can’t always be sustained by smaller initial teacher education providers. In Australia, for example, there has been a policy return to more individual development of final teaching assessments (Sachs, 2005), a practice that inspired the introduction of TPAs in the first place. While the Australian Institute of Teaching and School Leadership has established a separate TPA Expert Advisory Group to determine the appropriateness of TPAs that are submitted by ITE providers in the context of their program accreditation, the fact remains that the intention of introducing TPAs in Australia collaboratively, in order that they might be taken to scale, has had to be revised (AITSL).

Indeed, perhaps the most obvious challenge to success is the time and commitment needed to ensure that TPAs have fidelity across contexts, are robustly moderated, kept up-to-date and relevant to the contexts in which they are being enacted. At a time when teacher education programs worldwide are under intense resourcing pressure (Darling-Hammond and Lieberman, 2013), teacher educators are obliged to find additional time and support to develop TPAs. Again, referring to the Australian example, while the Australian Institute of Teaching and School Leadership provided some funding for those consortia initially successful in tendering to develop TPAs, this resource was in no way commensurate to the time and resource required to establish consortia and collaboratively develop the elements of the assessment instrument.

One significant criticism or challenge for TPAs, relates to the fact that much of the research into efficacy of TPAs, that is cited to encourage initial teacher education providers to adopt particular instruments in their programs, is often undertaken by the same personal involved in designing these tasks. On the one hand, this follows the long tradition of teacher educators as reflective researchers of practice and reflects the complex and institutional nature of research ethics clearance. On the other hand, it risks diminishing the claims that can be made about the impact and utility of TPAs. Hébert (2017) raises concern about the research evidence used to argue for the efficacy of the EdTPA, noting that this research is undertaken by academics central to the design of this task (Hébert, 2017, p. 69). He also notes, however, that a range of other Teacher Educators implementing the edTPA have written about its limitations in terms of ensuring pre-service teachers are appropriately “ready” for practice (citing Ledwell and Oyler, 2016); regarding the ways in which the assessment privileges certain kind of pre-service teachers (citing Greenblatt and O’Hara, 2015); and the manner in which the edTPA determines the content and focus of some ITE programs, obliging teacher educators to proverbially “teach to the test” (citing Dover and Schultz, 2016). In light of this criticism, Hébert asserts that this research, as well as more positive affirmations of the utility and relevance of the assessment, should be transparently available for future users of the TPA concerned (Hébert, 2017). This point draws attention to the somewhat conflicting motivations and imperatives for those responsible for designing and implementing TPA policy, points also acknowledged by Gallant and Mayer writing about the Malaysian TPA (p. 303). While teacher educators, in all instances, are initially involved in the design and implementation process, and are invested in researching their practice, and the broader utility of TPAs (Stacey et al., 2020), many are also implicated in the marketing of the TPA product, and obliged to be so, in order for the resourcing and upkeep of the TPA to be maintained.

Conclusion

Teaching Performance Assessments, for all the challenges of implementation and research, remain a key measure through which pre-service teachers’ ability to support diverse learners, and to assess pre-service teachers’ capacities to move into independent practice. The adoption of and investment in the development of TPAs by teacher education researchers, in collaboration with each other, governments and school-based stakeholders, highlights the ways in which these assessment tasks enable pre-service teachers to demonstrate authentic teaching performance that directs attention toward student learning and growth and away from the teacher as a “performer” (Kriewaldt et al., 2021; Stacey et al., 2020).

As we have outlined in this article, TPAs are not without challenges of implementation, most substantively concerning resourcing for development, assessment moderation and future refinement. If TPAs are ultimately to remain the remit and purview of teacher education providers and their stakeholders—rather than external commercial entities—then resourcing for infrastructure, development, data storage and analysis, will need to be prioritized by governments, and time will need to be allocated for work associated with administering and assessing TPAs within institutions.

While much research into the efficacy of TPAs has been done within specific national contexts (a practice for which teacher education research is often criticized) there seems significant potential for international and large-scale research to be undertaken which would enable initial teacher education providers to gather evidence of best practice regarding TPAs internationally. Post-pandemic, it will be valuable to better understand the factors and circumstances across contexts that are required to support the rigorous implementation of TPAs in ways that will develop pre-service teachers' ability use evidence to shape and respond to the learning needs of diverse students.

At the time of writing this chapter, the Federal government in Australia (where the authors are based), has recently released a further report into Initial Teacher Education, which, building on the previous report of 2015 (TEMAG) confirms the central place of TPAs in a reform and quality improvement agenda. Like many reports, this one directs attention to Initial Teacher Education as the panacea for educational challenges at a system level—it is imperative for scholars to resist and speak-back to assumptions made about initial teacher education and its assessments touted by such reports, and to clearly articulate the scope and purpose of ITE, and TPAs within a broader and complex education system (Ell et al., 2019). Going forward, and in the spirit of seeing ITE as the first step in a teacher's professional journey, it is worth exploring the potential of TPA-like assessment for practicing, in-service teachers. This notion has been taken up in some national contexts, see for example activities associated with the implementation of the Kentucky teacher evaluation standards (Guskey et al., 2010). Previous research undertaken in the Australian context has shown the utility of in-service teachers undertaking similar assessments to pre-service teachers, both for the integration of theory and practice across the career, and to ensure continuity of teacher professional learning (Kameniar et al., 2017; McLean Davies et al., 2017). Finally, while TPAs are, as we have noted, fundamentally tied to national professional teaching standards, further TPA generated research might be directed toward the standards themselves. Teacher education researchers might ask: "In what ways does the TPA being implemented reveal issues for standards and their interpretation?", and "What standards need modification so that teachers can authentically enact practice in social just and differentiated ways?" In this way, teacher educators can leverage their investment in TPAs to influence broader conversations about quality in teacher education and student learning.

Introduction

The existence of programs for preservice teacher education (TE) is not self-evident. The life and sustainability of such programs ultimately depend on the effects they have on teachers' in-service behavior. Effects of TE are defined here as durable consequences of the preservice acquisition of knowledge and skills and development of motives, as manifested in graduates' professional behavior. A stricter definition pertains to long-term effects of TE programs. Here, such effects are defined as durable consequences of participation in preservice programs which manifest themselves in professional behavior more than 1 year after the completion of preservice TE. It is the responsibility of educational research to demonstrate, describe, explain, and help optimize the relationship between preservice TE and the professional behavior which teachers exhibit and develop during their careers. The description and explanation of long-term effects of preservice programs lend greater credence to the utility of TE.

Relevance of TE effect research

Studying TE effects and especially long-term effects empirically is a relevant endeavor in several respects. Quantitative arguments in favor of TE effect studies deal with issues of recruitment, selection, and retention. Any country that wishes to sustain its educational system must know what contribution TE programs make to the availability and employability of its teacher workforce. Like no other component of a country's education system, TE possesses a multiplier function for the quality of schooling and learning throughout the system as a whole. TE programs deliver generations of teachers, who in turn educate generations of pupils and students, who on their part carry with them and transform the knowledge and skills acquired in school, college, or university during the rest of their lives and work. Indeed, the contributions that TE can make to the productivity of a country's educational system eminently justify research into the influence of TE programs on the teaching competence of their graduates.

Aim of TE effect research

The aim of TE effect research should be to explain the influence that specific features of preservice programs exert on teaching competence, especially in the longer run. If predictors of success in teaching can be found before and during TE as well as during beginning teaching and the further career, this evidence could underpin guidelines and strategies for improving TE learning environments. Empirical evidence about long-term TE effects could not only help increase retention in the profession, but also lay a basis for developing teachers' professional practice and well-being during all stages of their careers. The relevance of long-term effect

studies for policymaking in the domain of TE is clearly illustrated by the debate about what is an adequate or even the best architecture of TE programs, be they regular 4-year programs or alternative certification programs (e.g., [Darling-Hammond and Youngs, 2002](#)). Teacher shortages worldwide lend urgency to such questions. As yet, the empirical knowledge base for designing learning environments for teachers is growing, but seriously incomplete. There is a clear need for research which explains specifically how TE learning effects come about.

TE as a research field characterizes itself by an enormous complexity. Program effects are not exclusively influenced by program features, but these interact with the personal backgrounds of candidates and the varied contexts in which their schooling takes place. To explain the complex interplay between conditions, processes, and outcomes involved in teacher learning, an adequate research base is not yet available, the American Educational Research Association (AERA) Panel on Research and Teacher Education has concluded. However, improvements in research design are underway ([Cochran-Smith and Zeichner, 2005](#), p. 704). This conclusion is even more applicable when long-term effects of TE are taken as criteria.

This article focuses on what we know about TE effects as well as how we know it. Coming to grips with the complexity of teacher learning is crucial to scientific progress in the field of TE. The empirical evidence about effects of TE programs are therefore referenced with special attention to the strengths and weaknesses of TE effect studies. On this basis, validity requirements for TE effect research are explicated and productive research strategies are presented. For this purpose, a number of pioneering and exemplary studies serve as illustrations.

Contested ground. What we know about TE effects and how we know them

Empirical evidence about effects of TE programs has begun to emerge during the last decades of the twentieth century, both in Europe and in the English-speaking world. Toward the end of the century, growing teacher shortages in the United States spurred survey research on a larger scale into the outcomes of alternative certification programs. These programs, developed initially in the US since the 1980s, were intended to attract new candidates to the teaching profession ([Dill, 1996](#); [Zeichner and Schulte, 2001](#)) and often consisted of abbreviated or condensed versions of regular TE programs. The need to evaluate the adequacy of these programs has put effect research into TE programs, both alternative and regular programs, high on the agenda. However, long before that time, in fact since the formalization and institutionalization of TE programs began in the 1920s, qualitative research has been carried out representing the experiences of teacher educators in developing programs and of candidates while learning to teach.

The state of the art

The state of the art in TE effect research becomes apparent from seminal studies and research reviews in this domain.

Seminal studies

Seminal research exploring how teachers become and develop as teachers was reported by Lortie in his well-known book *School Teacher*. In two case studies using survey questionnaires and retrospective interviews, Lortie vividly showed and persuasively argued how a web of social and psychological forces conditions the ways in which teachers are socialized by the existing school system ([Lortie, 1975/1977, 1995](#)). Lortie's sociological angle reminds the reader of the risks of unreflective reproduction of craft traditions of teaching. In his wake, Lacey explored attitude change in aspiring teachers as they enter the school system and traced the various strategies of occupational socialization open to them. On the basis of five case studies, in which observations and questionnaires were used to follow prospective teachers as they moved from preservice TE through their first year of beginning teaching, Lacey ([1977, 1995](#), p. 619) distinguishes among internalized adjustment, strategic compliance, and strategic redefinition as possible ways for beginning teachers to deal with existing traditions in schools.

Until the 1970s, large-scale empirical evidence about long-term TE effects was virtually nonexistent; in fact, even now, shortly after the turn of the century, it is scantily available. The project Teacher Attitudes, carried out at Konstanz University in the south of Germany, was the first in Europe to demonstrate by means of path analysis on national longitudinal survey data the influence of specific features of preservice programs on outcomes in graduates ([Dann et al., 1978, 1981](#)). This project showed that program features encouraging the integration of theory and practice can delay and/or mitigate the occurrence of practice shock and the associated attitudinal adjustment to existing teaching practices. Building on work on types of attitude change, [Dann et al. \(1978, pp. 96–104\)](#) and [Müller-Fohrbrodt et al. \(1978\)](#) have identified as crucial in beginning teachers' socialization what they call discrepancy experiences; they experience a rift between idealistic notions developed during TE programs, on the one hand, and pressure from schools as institutions to rely on traditional patterns of behavior, on the other. These discrepancy experiences are strongest in situations where practical action is required ([Dann et al., 1981](#)).

This phenomenon of conservative attitude shift was demonstrated repeatedly in the US by the Pupil Control Studies initiated by Hoy ([Packard, 1988](#)). It was also documented in early qualitative research by [Corcoran \(1981\)](#), who described entry into teaching in terms of transition shock.

Perhaps the most important contribution of the Konstanz research group is that program characteristics were shown to differ in how fast and in what respects they influenced the U-curve in prospective and beginning teachers' attitude development ([Dann et al., 1978, 1981](#)). This evidence supports the conclusion that integrative approaches in TE, in which student teachers' practical experiences are closely linked to theoretical input, can strengthen graduates' innovative teaching competence ([Dann et al., 1978, 1981](#)).

Similar research and findings were reported from Hamburg by [Hinsch \(1979\)](#) and from the Netherlands by [Brouwer and Korthagen \(2005\)](#).

Research reviews

Both the European research referenced above and the comprehensive review undertaken by the AERA Panel on Research and Teacher Education in the US confirm that TE programs do influence graduates' learning outcomes. The AERA review contains indications that coursework can promote graduates' subject-matter knowledge and that methods courses combined with field work can have an impact on their professional behavior ([Cochran-Smith and Zeichner, 2005](#)). The beneficial influence of integrating theory and practice during teacher preparation on teachers' in-service performance was confirmed in the US by reviews and secondary analyses of partly cross-sectional, partly longitudinal survey data carried out by [Darling-Hammond \(1999, 2000\)](#). This synthetic work has yielded two important conclusions: (1) the amount and quality of teacher preparation are positively related to teachers' retention in the profession as well as their success in promoting student achievement and (2) teacher quality is the single most influential factor determining student achievement.

Taken together, these conclusions mean that preservice TE programs have a discernible and relevant influence on teaching and learning in schools, especially if they integrate practical and theoretical components. However, precisely how these effects come about and which specific program features are responsible for which kinds of effects are questions which require further study of a sophisticated kind.

How to research long-term effects of educating teachers?

So far, much TE research lacks the qualities needed to refine and elaborate upon the available evidence. [Wilson et al. \(2002\)](#) reviewed 57 studies about the impact of TE programs published in peer-reviewed journals mostly during the 1990s. They concluded that this research was often small scale, allowed researcher bias, employed few direct measures, and often lacked in detail in reporting about methodology. Similar criticisms were voiced by [Wideen et al. \(1998\)](#) in their review of the research about learning to teach. In their judgment, the theoretical basis of such studies should be made more explicit. They also note a lack of longitudinal research and advocate a systemic and ecological approach in TE effect research. Considering this state of affairs, the AERA Panel on Research and Teacher Education calls for research taking into account the contexts of TE programs, participants' backgrounds and characteristics, and how these relate to the processes and outcomes of TE programs. Such research requires employing longitudinal designs more frequently and a theory-driven conceptualization of outcome measures, whose operationalization should go beyond indirect verbal data.

These reviews, with quite a some consensus, point in the same direction. The outcomes of TE programs probably never result from a limited number of social conditions and personal characteristics. They had better be conceived of as resulting from a complex interplay of factors which simultaneously create and constrain opportunities for learning. To understand how this complex interplay affects teacher learning, a type of relational knowledge is needed, as described by [Apple \(1979\)](#); in other words, a systems perspective which pays attention to the manifold relationships between the components of TE as a social system. If TE effect research is to answer its questions, it would benefit not only from stronger conceptualization generally, but also, especially from using ecological and developmental concepts to theorize about its research object.

Modeling the object of research

In order to explain how all the factors operating in TE programs work together to generate teacher learning, TE effect research should rest on more systematic theorizing. A suitable vehicle for achieving this is the decision-oriented evaluation model introduced by [Stufflebeam and Webster \(1988\)](#). This model distinguishes between different types of variables, designated as context, input, process, and product (CIPP). When applied to preservice TE, context factors include the institutional and cultural constraints in schools, colleges, and universities within which TE programs are offered. Input factors include personal background characteristics of teacher candidates and the resources for training and guiding them on their way to beginning teaching. Process factors are the ways in which programs are implemented, including the degree to which and the ways in which practical exercise and theoretical study are adjusted to each other. These process factors are decisive mediators determining the nature of learning effects in graduates. These effects fall under the CIPP model component product. Models for TE effect research should take into account candidate, program, and context features and preferably include factors from each model component relevant for the study at hand. This kind of modeling encourages the researcher to examine the relationships and the balance of forces between influences emanating from TE programs and from school contexts in particular.

Ecological conceptions of the objects of social research go rather against the grain of mainstream educational psychology, but if the TE research community wants to develop a methodology that is congruent with theorizing about the complexity of teacher learning, it could consider a paradigm shift from a mechanistic toward an organicist worldview (cf. [Baltes et al., 1977](#)). In developmental psychology, ecological conceptions have long been available, notably in the work of [Bronfenbrenner \(1979\)](#), who situates the individual as one of the driving forces in a nested structure of systems, that is, the microsystem, in which he or she directly participates, the mesosystem, which constitutes the institutional constraints within which human activity unfolds, and the macrosystem on national and world levels determining the material and cultural conditions of human development. Researching the individual as an entity developing in its social context, warns Bronfenbrenner, is seeking to understand his or her exosystem, that is, how the relationships between the three subsystems distinguished mediate personal development.

Methodology of exemplary studies

What we know about TE effects is determined to an important extent by how we know them. Empirical studies are inevitably shaped by the way in which researchers relate their theoretical perspectives to their choice and use of methods. It is from this angle that we now examine an illustrative selection of exemplary TE effect studies in order to try to cull from the researchers' experience suggestions for conducting ecological inquiry into the influence of TE programs on the teacher workforce and its professional competence. The studies presented below are all examples of longitudinal research.

Phenomenographic studies

Since the 1970s, especially, there has been a host of exploratory, phenomenographic case studies into prospective and beginning teachers' experiences in becoming a teacher (see the review by [Wideen et al., 1998](#)). Most of this research is purely qualitative and involves small numbers of respondents, if only because the researchers lacked the resources to process large amounts of qualitative data. The result has been to describe in interpretive ways prospective teachers' experiences as they learned to teach. An advantage of this approach is that it can illuminate the processes and mechanisms involved in teacher learning, especially if the "inner workings" of the TE programs concerned are carefully described ([Cochran-Smith and Zeichner, 2005](#): p. 700). However, studies which restrict themselves to using only qualitative methods in small samples may fail to identify and explain which program features significantly encourage later performance in teaching practice. Without larger numbers of respondents and strategic sampling, TE effect research cannot produce generalizable knowledge about productive learning environments for teachers.

Large-scale quantitative studies

At the other extreme is purely quantitative survey research capitalizing on the law of great numbers, which uncovers patterns and relationships, notably concerning issues of recruitment (cf. the pertinent entry), selection, and retention.

A persuasive example is [Ingersoll's \(2001\)](#) demonstration of a revolving-door effect in teacher turnover. By analyzing with regression techniques the national longitudinal data sets in the US spanning 7 years, Ingersoll showed that contrary to public and political opinion, there are sufficient numbers of teachers available who are willing to fulfill schools' staffing needs. However, too many of them grow dissatisfied too soon with the work conditions in education and therefore move to different schools or leave teaching profession altogether. [Chin and Young \(2007\)](#) reported how personal backgrounds of alternative-route candidates such as ethnic status, age, gender, family obligations, and career history interact with local and regional employment opportunities as well as attractive characteristics of teaching as a profession in determining recruitment patterns.

In the area of teacher selection and self-selection, various longitudinal studies were carried out tracing the backgrounds, employment, and work experience of graduates of alternative certification programs. A review of these studies makes it clear that rather than general measures, such as grade point averages based on standardized achievement tests, candidates' cognitive skills, and levels of cognitive complexity, their self-efficacy and previous experience in instructing and coaching people in group settings have some merit as predictors of retention or at least success in teaching as rated by teacher educators and employers ([Brouwer et al., 2007](#)).

Time-dependent patterns in retention have been uncovered by [Shen \(2003\)](#), using large-scale longitudinal data. Dropout of beginning teachers was shown to increase with time, often in leaps at the beginning of a new school year or semester. In the same research, a positive relation was found between the length of training and the length of time teachers remained in the profession. In addition, support for teachers after graduation can influence their commitment to schools. Various induction packages consisting of different types of support for teachers who were new to a school were shown to differ significantly in their influence on percentages of turnover after the first year of employment. Much of the turnover occurred among teachers without any type of support during induction. Turnover was reduced among teachers who had supportive communication with school leaders, and even more so when they were given opportunities to collaborate with colleagues and had access to teacher networks and extra resources ([Smith and Ingersoll, 2004](#)).

In the area of attitude development, [Watzke \(2007\)](#) analyzed the development of work-related concerns in 79 beginning teachers using six repeated measures with a concerns inventory. [Fuller \(1969\)](#) and others have posited a stage chronology, which has tended to portray beginning teachers' development as a series of subsequent steps proceeding from concerns about maintaining a desirable presentation of self through concerns about performing teaching tasks proficiently to concerns about the adequacy of one's own teaching in promoting student learning. In contrast to this self-task-impact-stage chronology, concerns about impact on learners were shown in Watzke's sample to rank consistently highest across time. Concerns about impact, whether academic or personal in orientation, were shown to recur over time instead of characterizing one specific phase of beginning teacher development.

Mixed-methods studies

A study based on ecological assumptions and relating processes and outcomes is the reconstruction of competence development in 357 teachers from the beginning of preservice training until the third year of in-service practice reported by [Brouwer and Korthagen \(2005\)](#). Building on the work of [Dann et al. \(1978\)](#) and using a conceptual model derived from the literature on teacher socialization, this study assessed the relative influences on competence development of preservice TE programs on the one hand, and school contexts before and after graduation on the other. The methods used in this study were questionnaires, document analysis, observations, and retrospective interviews with student teachers as they developed into beginning teachers, cooperating teachers, and teacher educators. Among the main findings were that a carefully planned alternation of student-teaching and college-based periods, a gradual increase in the complexity of student-teaching activities, and the use of a clinical supervision model in cooperative small-group settings encouraged graduates' professional competence, notably their ability to activate learners.

Longitudinal mixed-methods approaches capable of addressing the complexity of teacher learning are also used on a larger scale in the Pathways into Teaching Project in New York City schools. In this project, comprehensive quantitative surveys are combined with detailed qualitative descriptions of an array of different TE programs and the learning experiences of the participants in them (Boyd et al., 2006).

Validity requirements

Against this backdrop of examples and with due caution, the methodological strengths and weaknesses of studies of long-term TE effects can be assessed as follows. Explaining relationships between TE program features and outcomes in graduates is facilitated by combining quantitative and qualitative methods. Using quantitative data from sizable samples enables the researcher to establish significant relationships and patterns and begin to generalize findings. Using qualitative data, preferably from direct observation, enables the researcher to reconstruct and infer from thick description (Geertz, 1973) in which settings and in which ways teachers acquire and transform professional teaching behaviors. TE effect research with explanatory power is further characterized by longitudinal rather than cross-sectional designs, repeated rather than one-shot measures, and multivariate correlational rather than experimental or quasi-experimental methods of analysis.

Given these experiences and trends in the conduct of TE effect research, it is appropriate to explicate what should count as valid causal explanations in an ecological conception of TE effect research. Therefore, two validity requirements are now presented for the benefit of explaining the complex whole of factors determining effects of TE programs. Conclusions about cause–effect relationships in TE effect research should be considered valid only, when:

- relationships are demonstrated on the basis of a research model incorporating context, input, process, and product factors and
- the processes responsible for these relationships are reconstructed.

The latter demand implies that explanations of human learning are incomplete, if only an experimentalist, black-box approach is taken. Such an approach would underestimate the role that subjective representations, such as perceptions, experiences, opinions, and attributions, play in human learning (cf. Maxwell, 2004). These two validity requirements embody a causal-genetic conception of scientific explanation in educational research and share important assumptions about the object of research as put forward in Bronfenbrenner's ecological conception of human development.

Suggestions for conducting TE effect studies

The validity requirements proposed above lay a basis for arriving at decisions about research design, instrumentation, data collection, and data analysis (cf. the criteria for research programs advocated by Bronfenbrenner and Läscher, 1976).

Design

An ecological conception of TE programs and effects as an object of causal-genetic explanation would entail including in the design of an empirical study the main settings of the college-based curriculum, student teaching, and beginning teaching in schools. Prospective teachers should be followed longitudinally from the beginning of training until the second year of in-service teaching, preferably longer. The instruments and measures used should allow recording and understanding the backgrounds, actions, experiences, and motives of the persons studied.

Combining qualitative and quantitative methods helps solve the breadth–depth problem in investigating TE programs and effects. If one type of method is used exclusively, either many situations and persons are studied superficially, or a few are studied thoroughly (Berger, 1974). A solution to this problem is to select, from all the programs and respondents in a study, a smaller number to form a representative subset. These may be termed the whole sample and the subsample, respectively. The whole sample can then be studied using quantitative methods, so that generalizable relationships and patterns can be discovered. The subsample can be studied additionally by means of qualitative methods, so that mediating processes can be reconstructed and explained in sufficient detail.

Instrumentation

In order to arrive at a multifaceted representation of both the outcomes and processes of long-term teacher learning, it is advisable to use multiple instruments for data collection (cf. for the original idea of a multitrait–multimethod matrix in social research, Campbell and Fiske, 1959). Not only self-report methods should be used, but also direct observation, so that attributions by any respondent group can be recognized for what they are and reliable accounts of actual professional performance can be achieved.

The operationalization of observations and measures is crucial for validity. Three epistemological perspectives, that is, assumptions about the nature of TE programs and effects can serve as a guide for operationalization: the ecological, genetic, and activity perspectives. The ecological perspective assumes that the research object in the social sciences always consists of a social system, which is at the same time internally structured and embedded within a wider, often institutional context (cf. Maschewsky, 1979; Tabachnick, 1981). The genetic perspective recognizes all learning as a set of processes, whose unfolding influences learning. This perspective assumes that understanding learning outcomes requires understanding the processes which produce them (cf.

Davydov, 1977). The activity perspective entails a focus on the actions of people as these express the continual tension between their personal motives on the one hand and contextual constraints on the other (cf. Zeichner and Tabachnick, 1985).

In quantitative inquiry, low-inference measures should be employed wherever possible. In qualitative inquiry, a balance should be sought between self-report and direct observation data. On-site visits, video recording of teaching, and retrospective and stimulated-recall interviews are therefore suitable methods.

Data collection

In an ecological inquiry of TE programs and effects, minimally, the main respondent groups should be involved, that is, prospective, beginning and/or experienced teachers, cooperating teachers, teacher educators, and/or professional development facilitators (cf. Cochran-Smith and Zeichner, 2005, pp. 331–334).

An important consideration in designing TE effect research is which time spans should be covered in longitudinal data collection. Decisions on this point are obviously made depending on the research questions and available resources, but it should be borne in mind that learning effects need time to come to fruition and to manifest themselves. To determine long-term effects of TE, it is advisable to cover time spans of at least 2 years. When following respondents over time, it is of course necessary to identify them, secure their consent with continued participation, inform them of the study's progress, and take all other measures useful for guarding against attrition generally (Mednick et al., 1984).

Analysis methods

Having based research design on ecological assumptions, TE researchers face strategic choices in analyzing pluriform data sets. Formulating and accounting for these choices with the help of a predetermined analysis plan can make or break a study's success. Evaluating any specific TE program in an ecological fashion confronts the researcher with social constellations and processes of unique complexity. Tracing distal causes and mediating factors will be prominent challenges (cf. Baltes et al., 1977). An analysis plan should therefore serve careful hypothesis generation and explicate the reasons why certain analysis techniques are selected and how their use is sequenced.

Given the validity requirement that the explanation of learning outcomes should rest on a reconstruction of the learning processes involved, it is logical to make qualitative analyses preceding quantitative ones, so that hypotheses can be generated and explored in a controlled way. If multivariate analyses yield clear indications of testable relations and/or differences, then experimental or quasi-experimental analyses can follow. This sequence conforms to the plea by Chatterji (2004, 2006) for extended-term mixed-method evaluation (ETMM) designs.

Finally, in analyzing quantitative longitudinal data, caution is needed in handling missing values. Attrition of respondents can easily cause individual data pairs to drop out of specific correlations and regressions. This risk increases to the degree that data pairs are collected further apart in time. To contain this risk, techniques can be used for estimating missing values (Peugh and Enders, 2004).

Conclusion

Qualifying and retaining teachers requires building an empirical knowledge base which can underpin program design in TE. Answering questions relevant for explaining and optimizing long-term effects of preservice TE programs can be achieved by means of carefully planned longitudinal studies combining quantitative and qualitative methods. TE researchers are well advised to conceptualize their questions using explicit, ecological models, which help them to theorize about the crucial role of mediating processes in generating learning effects in teachers. Research design, instrumentation, data collection, and analysis should fulfill validity requirements which are congruent with research models aiming at causal-genetic explanation.

If TE effect research were to succeed in mastering its challenges, evidence-based decision making could become possible in policymaking for TE. At the beginning of the 21st century, the greatest challenge for research into the long-term effects of TE is to help solve the dilemma of countering teacher shortages while simultaneously maintaining, enhancing, and assuring the quality of the teacher workforce worldwide.

Discussing teacher education is complicated because each country develops its own system and programs (Darling Hammond and Lieberman, 2012; Murray et al., 2019). Teacher education in general reflects each country's specific culture and values, context and industries/resources, and long-standing practices; these practices are usually tied to the country's short-and long-term goals (Christou, 2017; Moss, 2009, 2017). This article recognizes the tremendous variance in teacher education; even within the same university or country there are a variety of models for teacher education. Variance is useful; on the one hand, it allows universities to tailor teacher education for its teacher trainees yet on the other hand, there is the danger of teacher education programs being driven by a particular government or a Head of School/Dean's particular interests.

The difficulty in discussing teacher education globally is further hampered by a lack of consensus on such basics as terminology and more broadly on goals. For example, students in teacher education programs can be referred to as teacher trainees, student teachers, or preservice candidates. The term teacher trainees will be used throughout the article. The term teacher educator will be used to refer to those who hold university appointments (as opposed to school-based teacher educators whose primary appointment is in schools.) In order to contribute to this encyclopedia choices were made about what aspects of teacher education to discuss and present. Most of the research in this article draws on perspectives from western countries which does not disqualify the validity of work done in other regions; however, it allows the article to have coherence by presenting a number of prominent themes and developments which are applicable to specific countries. This article on teacher educators does not attempt to discuss **all** teacher educators rather it has chosen to discuss teacher educators working in specific countries and contexts. The article is divided into two parts: Part One is a General Discussion of Teacher Educators and Part Two presents two recent studies on teacher educators by the authors.

Part one: general discussion of teacher educators' lives and journeys

When discussing teacher educators two lines of inquiry must be considered: the government's role in teacher education and research on teacher educators. At times these intersect while at other times they run parallel. This article includes both lines of inquiry because this provides a more fulsome discussion of teacher educators. The article is organized into four sections: the first section provides a backdrop to the increasing politicized context of teacher education such as increased government intervention (one

¹We wish to thank the Social Sciences and Humanities Research Council of Canada for their generous funding of this project.

line of inquiry); the second section describes three key findings of research on teacher educators (second line of inquiry). These three findings were selected because they are relevant to the third section which presents findings on a study of teacher educators' journeys. The final section argues that teacher educators need to be fully recognized academics who have a broad knowledge base and should have a measure of academic freedom because they are researchers and need to be at the government table where decisions about teacher education programs are made.

Government intervention in teacher education

Over time some countries (e.g., England, Australia, United States) seem to have done a 360-degree rotation in understanding what it means to be a teacher educator. They shifted from conceptualizing teacher educators as being mentors (apprenticeship model) to teacher educators as full-fledged academics who are researchers with a degree of academic freedom to design academically challenging courses to reverting back to viewing teacher educators as mentors (Furlong, 2013; Murray and Passy, 2014; Whitty, 2014).

Moving from an apprenticeship model to an academic/intellectual endeavor

Beginning in the 19th century most preparation to be a teacher was conceptualized as an apprenticeship model (Cuban, 1987; Houston and Prentice, 1988; Labaree, 2006). The goal of teacher educators was to impart to teacher trainees "a set of independent, observable actions that together make up the coherent whole of teaching practice" (Russ et al., 2016, p. 393). Fries and Cochran-Smith (2006) note that teaching was regarded largely as a technical transmission activity which occurred in a linear manner (p. 77). Early Normal Schools in Canada and the United States which were the forerunner to teacher's colleges saw teacher education as a place to improve beginning teachers' literacy and mathematics skills (Labaree, 2000, 2006) in order for them to more capably teach children and adolescents a standardized curriculum. The teacher educators' job was to prepare teacher trainees to teach a narrow curriculum focused on basic skills such as hand-writing and oral reading. Gradually the value of teachers having some level of preparation through formal teacher education was recognized which led to most attending at least basic teacher training programs completing a diploma or certificate at Normal Schools or a free-standing teachers' college (Ducharme and Ducharme, n/d). During periods of the 20th century requiring teachers to be certified diminished for a variety of reasons (e.g., teacher shortages) which led to uncredentialed teachers being given emergency credentials (Darling Hammond, 2006; Darling Hammond and Lieberman, 2012).

The next significant step toward the professionalization of teachers was moving teacher education programs into universities. The move into universities (emerged during the 1980s in many countries and is still continuing) conceptualized teacher education as both an intellectual process and an opportunity for teacher trainees to acquire a broad range of practical skills (Dewey, 1916, 1938; Goodlad, 1998). Shulman (1986) argued that teacher education was not merely an apprenticeship and suggested that teachers and teacher educators required three types of specialized knowledge: subject matter content knowledge, pedagogical content knowledge, and curricular knowledge. Shulman (1986) provided a pathway for future research by suggesting there needs to be an examination of the specialized knowledge for teaching (e.g., Ball and Hill, 2009; Kennedy, 2006) and others such as Darling Hammond tried to demonstrate how it can be learned (2002, 2005). Adding to this body of knowledge, socio-cultural theorists (e.g., Vygotsky, 1986; Ladson-Billings, 2005) placed teaching into larger social and cultural practices (Palincsar, 1998; Lewis et al., 2020). Teacher educators and teacher trainees had to examine and understand the social, cultural, and historical context of schooling. From this intellectual or inquiry perspective, learning to teach required a broad skill set, certain dispositions, and an intellectual interrogation of teaching; therefore, teacher education had to be more than an apprenticeship. (See Rosales, 2019 for a description of history of teacher learning).

The move into universities not only expanded the curriculum of teacher education, but also led to the reconsideration of teacher educators themselves. The inherent culture of universities expects all faculty to be researchers and academics, not merely practitioners. However, the move to include teacher educators in universities was not without its problems. There have been scathing analyses of teacher educators (Ducharme and Ducharme, 1996; Labaree, 2006) questioning the legitimacy of teacher educators to be full-fledged academics. The conundrum of moving teacher education from an apprenticeship model to an intellectual endeavor housed in universities brought concomitant problems which are still being realized (Goodlad, 1998). Were teacher educators outstanding teachers or were they full-fledged academics? The education community continues to wrestle with this question.

Dismantling traditional teacher education

In many countries over the last four decades, education and teacher education have been squarely placed in the cross-hairs of government agendas further confounding the situation. Broad-sweeping government intervention into teacher education in many ways upturned teacher education:

Something dramatic has happened to teacher education policy in the last 30 years. Up until the 1980s, in virtually every country around the world, teacher education was a relative backwater in terms of educational policy. In a world of intense competition among nations, education increasingly plays a key role. National prosperity, social justice, and social cohesion are all seen to rest on the shoulders of education.

Furlong (2013, p. 29).

As Furlong notes here, the stakes in education have been raised because it is seen to be one of the saviors for society and the economy. This stance has led to significant interference from governments. For example, in England the government has determined the number of days student teachers must spend in practice teaching schools (Murray and Passy, 2014, p. 497) which has diminished their connection to the university. Gilroy (2014) wryly observes that in 1992 the Secretary of State “launched a ferocious attack on university teacher education ... where he made it clear that only a tiny rump of courses would be left in the hands of higher education, with teacher education quickly to be moved to schools” (p. 623). Following suit, the US governments (federal and state) are increasingly inserting themselves into teacher education (Kosnik et al., 2016).

Tony Blair, Prime Minister of the UK from 1997 to 2007, was one of the first to ardently argue that teaching and teacher education were tied to national prosperity (Moss, 2009, 2017) but rather than elevate the role of teacher educators his government started a march to diminish and do away with formal teacher education programs and reduce teacher educators as academics (Furlong, 2013). To ensure national prosperity the “answer” was to improving the knowledge and skills of their citizens was the re-emergence of teacher education as an apprenticeship so that teachers could teach a ready-made, pre-set curriculum devised by the government (e.g., Literacy Hour). Governments seized almost full control of teacher education but quite illogically supported alternative certification programs which are the antithesis of teacher education as an intellectual endeavor (McNamara and Murray, 2013; Mitchell and Romero, 2010). Alternate certification programs are truncated programs often only a few weeks in length with many teacher trainees being taught a “script” for teaching. Therefore, the government believed that by removing as many variables as possible (teacher educator choice) they would improve the skills of all children. One of the first significant threats to university-based teacher education came from Teach for All, a global network of alternative certification programs which currently (2020) has partners with 50 countries. For example, Teach for America and other alternative certification providers have been so successful that approximately 20–30% of teachers entering teaching in the U.S. come from an alternative pathway (Zeichner and Conklin, 2016, p. 2). A host of other alternative certification providers emerged. In Britain there are now 1500 providers for teacher certification (Gilroy, 2014).

What began in the early 1980s as a way to ward off projected shortages of teachers and replace emergency certification has rapidly evolved into an accepted model for recruiting, training, and certifying those who already have at least a bachelor's degree and want to become teachers.

National Education Association (n/d).

One of the most questionable assaults on teacher educators has emerged from so called “reformers” who could be described as edupreneurials (Anderson, 2019, p. 13). One of their initiatives is what Cochran-Smith et al. (2018) call new graduate schools of education (nGSE) “which are independent organizations that offer teacher preparation programs and use university language, such as ‘graduate school of education’ ... ‘dean’ but are not affiliated with universities” (p. 575). They do not adhere to traditional university structures (e.g., practice teaching blocks), ignore important goals (e.g., developing teachers as decision-makers), and do not address a rich and varied curriculum practices (e.g., how to teach a diverse student body).

Quite perplexingly, teacher educators in alternative certification or edupreneurial programs often do not have higher education degrees, nor are they involved in research on their venture (Anderson, 2019). “Some of the leaders of nGSEs are former [Teach for America] TFA members, while many faculty are school-based educators who focus on effective practice” (Cochran-Smith et al., 2018, p. 576). Anderson (2019) presents the New Schools Venture Fund (NSVF) as an example of an edupreneurial reformer, initially focused on expanding the number of charter schools but since 2009 “are trying to profoundly disrupt the current teacher preparation market” (p. 8). Typically, nGSEs programs “disavow theory and social foundations” (Anderson, 2019, p. 7) and prefer Lemov’s “codification of discrete techniques that can be taught quickly to teachers” (2010, p. 16). Zeichner and Conklin (2016) observe that 40% of some programs are delivered through on-line instruction (p. 13) which makes the programs cheap to run thus appealing to for-profit companies.

There has long been oversight of teacher education programs; however, the level of compliance has been vastly elevated (Sahblerg, 2012a,b). The English government established the Office for Standards in Education, Children’s Services and Skills (OFSTED) which dictated not only what needs to be taught but how it should be taught (Yandell, 2012, 2016). For example, in England the government not only describes the content of the literacy programs in schools but also how literacy should be taught in both schools and teacher education programs. In many cases, teacher educators are being asked to return to a narrow delivery content and skills.

As noted earlier, questioning the rightful place of teacher educators to be university faculty has persisted. Cochran-Smith et al. (2018) argue that “teacher educators have been positioned as the objects of reform and the implementers of reform agendas developed by others, rather than as the agents of reform” (p. 573). An intended or unintended consequence of the government support for alternative certification programs jeopardized teacher educators, in particular their role—were they trainers or academics? As academics they would be required to have higher education degrees, be research-active, be able to secure grants, participate in scholarly conferences, and infuse their teaching with research. As trainers, they act only as mentors for apprentices.

Many teacher educators responded forcefully to government intervention by defending teacher educators as full-fledged academics who needed to develop programs for the 21st century not retreat to 19th century models. While some governments are attempting to dismantle teacher education programs by allowing alternative certification programs and nGSEs to be recognized, there is increasing attention by the international teacher education community to teacher educators themselves (Ellis et al., 2014;

Goodwin and Kosnik, 2013; Info Ted, 2019; Loughran, 2006). The European Commission (2009, 2013) recognizes there needs to be more commitment for supporting teacher educator learning. The teacher educators' efforts to preserve university-based teacher education has had limited success because governments began dismantling traditional teacher education in a number of ways such as reducing the number of days spent in academic programs at the university giving schools more control over the process (Florian and Pantic, 2013).

Research on teacher educators

In this maelstrom of attacks on traditional teacher education, teacher educators were caught between two diametrically opposed views: did they construct their programs as an apprenticeship or did they design it based on an intellectual model? Grappling with this distinction has been difficult and not yet "resolved." These are not mutually exclusive but each model will drive the content and format.

Nevertheless, research on teacher educators has grown substantially in the last two decades showing that they are not a homogenous group (Kosnik et al., 2013, 2014, 2017; Mayer et al., 2011; Mayer, 2014; Murray, 2016) with there being many paths to becoming a teacher educator (Murray et al., 2019), and that the political context is impacting them (Kosnik et al., 2020; Lambert and Burnett, 2015; Loudén, 2008; Peters et al., 2017). These key findings must be fore-fronted in order to understand the complexity of the situation. Although there are many important insights gained from the research on teacher educators, only three specific aspects will be discussed. They were selected because they connect to Section Three of the article and show the short-comings of the alternative certification programs described above.

Transition from classroom teacher to teacher educator

The ground-breaking article *Becoming a Teacher Educator: Evidence from the Field* by Murray and Male (2005) showed that the transition from classroom teacher to teacher educator was not a simple process:

The transition from the first-order setting of school teaching into the second-order setting of HE (higher education) based teacher education was constructed by the majority of the interviewees as a distinct and stressful career change, characterized by high levels of uncertainty and anxiety. Recurring feelings about the early years of HE work were of being "de-skilled", of "struggle", and of "masquerading" (p. 129).

The move to higher education was in many cases difficult. Murray and Male (2005) elaborated: "[t]hemes of 'survival', anxiety about 'fitting in' and striving to make sense of HE work were dominant in the accounts of life in the first year of teacher education work. Despite their school teaching experience, 26 of the interviewees reported feeling exposed, vulnerable and uncertain about their new teaching roles in HE ... there was no straightforward 'transfer' of the pedagogical knowledge and experience acquired in and through school teaching to the HE context" (p. 130). Over the years, Murray and Male's (2005) findings have been substantiated by multiple researchers (Dinkelman et al., 2006; Hokka and Etelapelto, 2014; McKeon and Harrison, 2012) adding depth and nuance to understanding the fraught shift from classroom teacher to teacher educator. As research on teacher educators mushroomed, issues regarding being a teacher educator that had previously been "invisible" emerged. For instance, White (2016, 2019); White et al. (2018), from Australia identified the massive demands on teacher educators as they developed school university partnerships.

Further, the issue of teacher educator identity emerged as a pivotal aspect for teacher educators given the dismantling of traditional university programs. Are they classroom teachers? Are they academics? Are they both? Kosnik et al. (2013) in their paper *A Foot in Many Camps: Literacy Teacher Educators Acquiring Knowledge Across Many Realms and Juggling Multiple Identities* argued that "since much of teacher educators' work was in schools (supervising student teachers, conducting research) they must be able to 'talk the talk' with teachers. They cannot shed their teacher identity completely when they secure a faculty position" (p. 535). In the current milieu, it seems that university-based teacher educators must hold multiple identities and have a broad skillset that includes teaching, research, building school-university partnerships, working with school districts, being advocates for teacher education, and actively participating in service to the university.

Knowledge bases for teacher educators

In an apprenticeship model, teacher educators would have been expert classroom teachers but from the perspective of teacher education as an intellectual endeavor Zeichner (2005) argues that preparation for teacher educators needs to be more expansive: "If teacher education is to be taken more seriously in colleges and universities, then the preparation of new school- and university-based teacher educators needs to be taken more seriously as well" (p. 124). Cochran-Smith (2003) argues that we need to pay "more attention to what teachers of teachers themselves need to know, and what institutional supports need to be in place in order to meet the complex demands of preparing teachers for the 21st century" (p. 6). To be able to handle this complex role requires many skills and extensive knowledge; however, for most new teacher educators there is little to no preparation.

As the research on teacher education expanded Korthagen (2010) and Loughran (2006) work on a pedagogy of teacher education revealed the complexity of the task; teacher educators must teach about teaching which requires different pedagogical skills and knowledge than simply being an expert teacher. In Loughran's ground-breaking text, *Developing a Pedagogy of Teacher Education* (2006), he argued teaching about teaching is a very different enterprise than teaching school children. He states that "[b]eing a teacher educator requires an understanding of teaching that goes beyond being a good teacher. There is a need to be able to theorize practice in such a way as to know and be able to articulate the what, how, and why of teaching and to do so through the very experiences of teaching and learning about teaching" (2006, p. 14). In later work, Loughran and Hamilton (2016) argue that since this "practice is so complex ... learning to teach must indeed entail considerably more than a training regime" (p. 5). Teacher education pedagogy must also go beyond modeling good practice; Williamson (2013) notes that "it is not enough for teacher educators to model instructional practices without being transparent about their pedagogical thinking. Much about teaching is invisible to the novice eye, and explicit modeling allows educators to unpack the pedagogical decisions that they make in their planning" (p. 137).

Identifying the knowledge needed to be a teacher educator where teaching is seen as an intellectual endeavor (rather than an apprenticeship) has led to various delineations. Murray and Male (2005) identified knowledge that new teacher educators need: the acquisition of the pedagogical knowledge and experience appropriate to being a teacher educator in HE; the enhancement and generalization of their existing knowledge base of schooling; developing an identity as a researcher; developing ways of working with mentors in school-based settings; acquiring pragmatic knowledge of the HE institution and how it operates (p. 158).

Goodwin (2008, 2012) approached the issue of knowledge by identifying five domains of knowledge that teacher educators require: personal knowledge/autobiography and philosophy of teaching; contextual knowledge/understanding learners; schools and society; pedagogical knowledge/content, theories, teaching methods and curriculum development; sociological knowledge/diversity, cultural relevance and social justice; and social knowledge/cooperative, democratic group process and conflict resolution.

Kosnik et al. (2015) in their study of literacy/English teacher educators in Canada, US, England, and Australia identified four spheres of knowledge for literacy/English teacher educators: knowledge of research; knowledge of pedagogy of teacher education; knowledge of literacy and literacy teaching; and knowledge of current school and government initiatives.

Common features in these knowledge bases are: knowledge must be extensive, including practical, theoretical, and contextual. Compared to traditional academics (e.g., chemistry, history) teacher educators must know about both research and practice situated within the socio-cultural context. Compared to instructors in alternative certification programs, university-based teacher educators must be much more than practitioners.

Teacher educators as researchers

As noted earlier, the move from teachers' colleges to universities raised many thorny questions. One of the most difficult has been the extent to which teacher educators should be researchers. In the three lists above (Cochran-Smith, 2003; Goodwin, 2008; Kosnik et al., 2015; Murray and Male, 2005) knowledge of research is included but that matter is far from resolved or fully understood. Are they consumers of research? Are they generators of research? Does research guide their teaching?

Becoming and being a researcher is difficult and is not typically in the purview of the work of classroom teachers; therefore, when teachers move to HE to be teacher educators there is often sudden additional demands to be both consumers and producers of research. Lunenberg et al. (2014) report that many university-based teacher educators consider being involved in research as part of their work and Loughran (2014) suggests that teacher educators should conceptualize their growth as a "research journey" (p. 2). However, striving to be a quality researcher increases pressure on teacher educators because it is another significant knowledge base for them to acquire and an important duty to fulfill. "Some teacher educators have developed expertise as researchers before or during their work as teacher educators [but] others have not" (Tack and Vanderline, 2014, p. 299). Becoming a researcher is not a straightforward process because it includes acquiring skills, expanding your academic communities, and shifting your identity (Murray and Male, 2005; Lunenberg et al., 2014). Tack and Vanderline (2014) describe a "researcherly disposition as the habit of mind to engage in research and thus to produce both local knowledge and public knowledge on teacher education. This researcherly disposition embodies three interrelated aspects: an ability to conduct research; a sensitivity to research occasions, and an inclination toward research" (p. 301).

MacPhail et al.'s study (2018) asked 61 higher education teacher educators (from England, Ireland, Israel, Norway Scotland, and The Netherlands) about their professional development needs. They found: "[t]here is an inextricable link between teaching and research. Teacher educators were unanimous in the need to keep abreast of recent developments that would inform their teaching" (p. 8). Yet many have extremely heavy teaching loads with limited time to read research and do not have a research background or the skills to conduct research. "There was a clear frustration for a number of teacher educators that the higher education institutes' research-active rhetoric did not match the university support structures" (p. 9). Czerniawski et al. (2018, p. 141) looked at professional development needs of teacher educators in England, Ireland, and Scotland and identified four top categories: current developments in teacher education; curriculum development; scholarly writing (e.g., articles, chapters, learning materials, and researching one's own practice). Teacher educators need assistance with developing research skills.

Part two: teacher educators' lives and journey²

This article now presents data from two research studies that the authors have conducted. The first study *Literacy Teacher Educators: Their Backgrounds, Visions, and Practices* included 28 literacy/English teacher educators (LTEs) from four countries: Canada, US,

Table 1 Background of participants—data as of 2019.

Country		
Canada—15 participants US—22 participants UK—12 participants		
Australia—10 participants		
Overview of experience		
	Years as CR teacher	Years in higher education
0	2	
1–5	9	17
6–10	9	22
11–20	10	19
20+	1	20
Unknown	2	1

England, and Australia who were interviewed between 2014 and 2017. The second study, *Pedagogy of Literacy Teacher Education: Meeting the Challenges of 21st Century Literacies* recruited 30 additional literacy/English teacher educators. The literacy teacher educators (LTEs) were interviewed in 2019. The overall goals of both studies are:

- (i) Primarily, to study in depth a group of literacy teacher educators, with special attention to their backgrounds, views, and practices and their experiences, induction, and support within the university.
- (ii) Contribute to emerging theory on a pedagogy of literacy teacher education.
- (iii) Investigate factors that affect LTEs' pedagogies and views.

The 58 participants were interviewed using a semi-structured format which took approximately 60–90 min. Interview questions included those on: background (e.g., timeline of turning points), topic of Ph.D. research, experience as a classroom teacher; influences on their current practice; qualities of a teacher educator; academic community; framework and goals for their literacy course(s); pedagogies used and reasons for using them; assignments and readings; and equity and diversity. Studying the work of LTEs adds to the research base on teacher education because it looks at those in a specific discipline—literacy—and looks at how they are responding to the current intrusion of the government. **Table 1** is a summary of the backgrounds of the participants.

Goals for their courses

Across both studies there was extensive examination of goals LTEs set for their courses. All 58 LTEs stated that building knowledge of literacy was their top priority. Their goals were broad moving beyond simply teaching to a script. It shows that knowledge of literacy although the main goal is supplemented with goals that are positioning literacy within a cultural and political context. Other goals mentioned were:

- Build knowledge of pedagogy
- Student teachers adopt a professional role
- Student teachers develop a critical stance
- Build knowledge of government initiatives
- Build knowledge of digital technology
- Focus on student teacher growth

One of the goals mentioned consistently across both cohorts was helping teacher trainees become what Justin³ called “public intellectuals.” Teachers need to be much more than technicians; therefore, their teacher education program needs to be more than what Jeff calls “teacher proof.” He felt that his job was not doing “teaching for dummies” but to help teacher trainees have a much deeper understanding of teaching. Padua's aims were to prepare his teacher trainees to understand that the current national curriculum in England and Australia are “prescriptive and narrow in their conceptual arrangement” but he felt that “we are duty-bound as academics to provide [teacher trainees] with a much broader conceptual frame than some of these initiatives allow for.” In designing his courses/modules Jeff wanted to find “a place where I can have rich discussions ... to me it's what are these questions that are gnawing at you that I put in your head that is going to make it easy or hard for you to implement that curriculum.” Tessa from Canada oriented her courses to help her teacher trainees become “critical consumers ... and not technicians” of the curriculum. Through their course goals they were indirectly (and at times directly) pushing back on government mandates by opening up spaces for discussion and critique.

Over time, the impact of politics and government intervention does not seem to have lessened. Overall, the LTEs were trying to preserve the concept of teachers as intellectuals. A theme common to the 58 participants was an emphasis on teacher trainee survival. Madelaine echoed the sentiments of many:

²See appendix for methodology.

³Pseudonyms used throughout.

We have to give [teacher trainees] the survival skills, which means understanding and knowing how to implement things that maybe we don't think are ideal but at the same time preparing them to bring about a better world. At the same time, we are also saying to them what is there right now and this is how you navigate it but this is what theory and research is showing is optimal learning conditions. I don't think it is fair for us to put that utopian vision in the most vulnerable people in the population, the teaching populations, and say fix the mess that we couldn't.

Both LTEs and teacher trainees were feeling pressure to implement “reforms” that conceptualize literacy narrowly (Kosnik et al., 2020). The LTEs aimed to prepare teacher trainees in many ways: build their identity as professionals, connect theory and practice, and encourage them to think about the big questions in education.

To meet the multiple goals for their work, LTEs felt they must have a broad knowledge base that spans theory and practice, have a vast repertoire of pedagogical skills, be very thoughtful in course construction, and be aware of the current political context. They needed to create learning opportunities that maximize on the limited contact time they had with teacher trainees. The next two sections describe some of the goals for their courses/modules in more detail. These were chosen because they root their goals in a discipline (literacy) and give concrete examples of the ways LTEs and teacher trainees go beyond a scripted curriculum or teaching to the exit requirement test such as a test or portfolio in order to be credentialed.

Conceptions of literacy

For most of the 58 LTEs, literacy was not seen as a practice synonymous with the discrete and autonomous skills of simply reading and writing as Lemov (2010) does. Although many current government curricula have a narrow view of literacy, most LTEs understood literacy as a complex social practice in which historical, cultural, social, and technological perspective are at the center (Kinloch et al., 2020; Menna, 2013; Milner et al., 2015; Souto-Manning and Stillman, 2020). It is fairly accurate to describe their approach to literacy as highly progressive seeing literacy as an expansive practice that includes the influence of digital technologies on communication, attention to home languages, and power dynamics at play in literacy education. For the most part their goals were not consistent with the government-developed curricula which often focuses intently on synthetic phonics, teaching writing according to a script, while minimizing digital technologies as a form of communication. Sonia from the U.S. described the dilemma both LTEs and teacher trainees face:

the classrooms are not necessarily implementing the type of literacy instruction that I'm advocating for ... I'm telling them to do A, and they're not seeing it, they're seeing B in the classroom, so that is a huge problem ... I'm teaching culturally relevant responsive and sustaining pedagogies. They have a very, very hard time wrapping their heads around that.

Through the design of their courses, readings selected, assignments set, inclusion of guest speakers, and connections with the community many of these LTEs were moving beyond teaching to a script. For example, Karly in the US, who had a long history of being involved in activism, partnered with local schools where teacher trainees were assigned to educators who were activists and were pushing back on the prescribed curriculum. Karly felt that the combination of her academic course, which made space for critical conversations, alongside placing teacher trainees with progressive teachers made an impact on teacher trainee learning and development. She described the effects through the following themes: how teacher trainees relate to the formal government curriculum; ways that teachers can move beyond a test and drill of skills; and broadening their conceptions of literacy. Like many others who provided these rich experiences, Karly felt these were aspects were transformational. This is a stark contrast to the alternative certification programs discussed earlier which tried to compress the teacher education program into a few weeks.

Rosetta from the UK recognized that the national curriculum had a “big emphasis on phonics.” Like others she felt she needed to teach to the curriculum; however, noted: “[we] do try and get the students to critique that, so we are quite torn with this. We wouldn't advocate the way that it's suggested that it's being taught ... so we're kind of constantly asking them to rethink and think about ways in which they can contextualize what grammar is.” Robert also working in the UK identified yet another issue with the current narrow curriculum. Based on his work and research he found that school children felt that the highly prescriptive curriculum was “dull and they're jumping through hoops. The teachers fall into this pedagogy where they feel that they're doing the right thing [because] they have taken this idea from the government that they must do this.” He felt the narrow, mandated curriculum which was supposed to be focused in their teacher education programs had deleterious effects on the children, teachers, and teacher trainees. Everyone was losing. Most tried to give their teacher trainees a way to understand literacy as a complex social, relevant, and engaging complex process.

The examples listed above are a far cry from an apprenticeship model where teacher trainees learn to teach a script because; rather, the 58 university-based teacher educators in these studies have adopted a very broad approach to their work. The practices and pedagogies of the LTEs described above requires a knowledge of pedagogy of teacher education, a deep understanding of literacy, an in-depth knowledge of classroom teaching, and an awareness that teaching occurs in a very complicated context. They acquired this knowledge (and continue to grow and learn) through advanced educational studies, reflective practice, collaboration with others, reading widely, being involved in multiple communities, and conducting research. It is a life-time work and commitment.

Preparation to teach mandated curriculum: conflicting agendas

Many LTEs experienced a collision between the goals for their courses and the government mandates. Navigating this conflict was not an easy or straight-forward process because there was no “play book” for this kind of teaching. Karly reconciled this conflict because she felt that teacher preparation programs “have a responsibility to make sure students are aware of the government directives and the socio-political context in which they will be walking into.” However, she tempered this position by elaborating, “I do not think it’s the responsibility of teacher preparation programs to prepare students to implement the government’s agenda, standards, curriculum directives.” This is the horn of the dilemma in which many LTEs are caught: acquiescence or non-compliance with the government mandates.

Justin noted that he had lived through five national curricula. Similarly, Elan takes the “long-view” regarding preparing teacher trainees to focus on the current curriculum:

it’s kind of a fool’s errand to prepare them to implement any particular initiative because it’s going to be gone by the time that they’re there. They need to be able to think on their feet, and they need to be able to figure out what part of the initiative was consonant with their own beliefs about literacy development and literacy education, what parts aren’t, and how do you negotiate that before you have tenure.

Many of the LTEs lamented that it is proving to be more difficult to find the time for important and critical conversations. As Karly argued: “It’s important to embed practice within questions of the larger purpose of education and what our beliefs are and what’s most important.”

Without a doubt the LTEs’ contexts were impacting their course goals and pedagogy both overtly and subtly. For example, the oversight by OFSTED was seen as a real and menacing threat. Padua described how he was formally disciplined because the OFSTED reviewers thought he did not place sufficient emphasis on teaching synthetic phonics. LTEs in the US and Australia felt the exit outcome (e.g., [edTPA](#)⁴) caused teacher trainees to focus on what they had to do due to “pass the test” rather than have a longer-term goal of gaining a deep understanding of the teaching and learning process.

Place of and doing research

All LTEs felt that doing research and being knowledgeable about research were part of their work and role. The ability to conduct research requires skills that classroom teachers may not have acquired. All 58 LTEs had completed a Ph.D. where they developed research skills, gained a respect for research, and know how to use research to guide teaching (in both schools and in higher education). Many were part of international research communities which gave them a wider world-view so they could get a sense of what was being done in other countries. Participation in research communities beyond their university or country was described as a turning point in their work as LTEs.

The LTEs research was not kept in a “silo” rather it influenced their practice and identity. Sam spent significant time reading research because “it’s that kind of research that keeps me asking questions about effective practice.” All saw doing research as an essential part of their work. Madelaine describes how being a research affects her teaching:

doing research, both in our lab schools and other schools, how much enriched my understanding of teaching and learning and I have then translated that into my courses and across the whole department because we are integrating a different approach to digital technology across our whole department based on what I learned from my research ... doing research is [integral] to my job and my level of satisfaction.

Conducting research, however, is not neutral. For example, one LTE did critical discourse analyses of literacy policies showing its shortcomings. In some ways their research could be conceptualized as a form of resistance. For example, Padua commented “what worries me is the imposition of neo-liberal ideology, politics, economics, on the educational system” and his research revealed how this is playing itself out in schools. While Tessa who had done significant research on Indigenous students’ classroom experiences found traditional literacy programs were “harmful in the way people are storied as readers and writers impacts them for the rest of their life.” This led to her inviting Indigenous Elders to be guest speakers and in turn develop responsive practices that reflected the needs of her learners.

Tanya in the UK felt that her research opened up new avenues for understanding children and literacy. She described how her work with colleagues led her to question much of her practice:

[The researcher] took tape recorders into the homes and they interviewed the kids. They observed them several times, always in challenging areas. She was just shocked. What she saw shocked her and kind of slapped her around the face. Then when she came back to share it with me and with other teachers it shocked all of us. Everybody was shocked everywhere. Because we just had no bloody idea and we all thought we were trying to do our best.

⁴edTPA is a performance-based, subject-specific assessment and support system used by teacher preparation programs throughout the United States to emphasize, measure and support the skills and knowledge that all teachers need from Day 1 in the classroom.

This experience led to Tanya leading a country-wide initiative on reading which some saw as a very political act.

Research as a form of resistance played out differently for Alicia. “I’ve become more politicized because I’ve seen problems, I’ve seen issues being pushed through and the impact of those issues on children and on my colleagues. So I guess I just became alert through the research definitely because of my reading and also through the leadership role issue.” Having learned significantly from her research she willingly accepted a senior administrative position in her university to try to stem the tide of harmful reforms.

Table 2 provides examples of current research done by the LTEs which shows that their research moved beyond the limited confines of studying the mandated curriculum. They explored relevant timely topics which addressed the complexities of literacy:

These examples show that the LTEs’ research was contributing to a counter-narrative to the governments that are pushing through a narrow view of education. Being consumers and generators of research enhanced their knowledge base; refined their research skills; and influenced their pedagogy of teacher education. The following section describes the influence that conducting research had on their identity. They did not see themselves simply as trainers but as academics.

Identity

There were a number of questions about identity in the interviews (e.g., turning points; term you would use to describe yourself; own strengths). As described earlier, teacher educators must have multiple identities (Kosnik et al., 2013): identify as classroom teachers, researchers, and higher education instructors. Nora described her complex identity as:

I think teacher educators get to be in this amazing liminal space we cannot totally just fly into academic world because these [teacher trainees] are going to be in front of kids, and I want to show them that theory matters, but I need to make sure I’m building the bridge to how theory relates to the practice you enact every day.

These LTEs were not plucked from classrooms to teach a script or to act as mentors to apprentices; rather, they drew on their rich experiences (e.g., teaching in developing nations, working in programs with marginalized youth) when creating their courses. What is significant is not only that they had a wide-range of experiences but also, that for the most part, they examined these experiences in their doctoral programs. For example, Manuela described “a major turning point was just engaging in my Ph. D. in the College of Education. I don’t know if everybody is sort of blown over by this when they start with those early social foundation courses but going like, Oh my god. Education is not a meritocracy.” The doctoral experience also provided them with a set of colleagues with whom many still collaborate. For many their former thesis supervisor and (former) fellow doctoral students were their academic communities which further reinforced their identity as researchers.

The LTEs saw themselves as full-fledged academics believing they have a place in the university. Sam wryly stated that the government “would prefer to call us teacher trainers rather than teacher educators so I would rather be called a teacher educator than a teacher trainer.” He did not see himself as merely a trainer. For many they worked hard in their Ph.D. programs and identify as researchers so they do want to revert to becoming trainers. However, there were pressure points because of the unintended consequences of the current politicization of teacher education. For example, many felt they no longer wanted to teach literacy courses in teacher education because they believed they did not see themselves as trainers nor did they want to teach a mandated curriculum. The LTEs have complex identities because of their work which requires them to straddle both schools and the university. Ciara in Canada said that she feels like a “border crosser” which is demanding. Many described how they often felt like second-class citizens in their university (Kosnik et al., 2013) because they were closely tied to schools and with government conceptualizing and calling them trainers they felt it further marginalized them. As a result, many were opting out of mandatory literacy courses in teacher education preferring to teach electives or doctoral level courses where they had more independence, less scrutiny, and more connection to their full-time colleagues in the university. For some, they had to choose where to focus their work—on teaching or research. For many they valued both but felt forced. Some described it as a “push and pull” because their universities wanted them to increase research productivity while in other cases they had to increase their teaching load. This impacted their identity—to be a researcher or not to be a researcher? Another unintended consequence of the current context was a reduction in fewer full-time LTEs because of

Table 2 Current research being done.

<i>Karly</i>	<i>Impact of student-driven service learning projects</i>
Manuela	Identify centrally important practices or core practices for teaching English language learners
Simona	Help teachers teach literary in ways that move away from formal and academic programs
Katreena	Study of teach for America programs and teacher trainees enrolled in those programs
Giovanni	Place of community-based literacy programs
Pietro	Study literacy experiences of youth who have been incarcerated

budget cuts. To fill the void more and more sessional instructors were teaching the mandatory literacy courses. The LTEs certainly respected and valued the sessionals but there is a difference in identity between sessional/contract instructors and a full-fledged academic.

Doing a Ph.D. had a long-term impact on the LTEs. Rather than being a “one-off” experience it provided them with ways to deepen their knowledge about literacy, helped them recognize the social-political context of literacy learning/teaching, taught them how to read research, provided them the skills to conduct research and ways to use their findings in their teaching, and reinforced their identity as researchers. Having committed a minimum of five years to their doctoral studies it influenced their identity with many calling themselves researchers. Diane proudly stated: “I really value my researcher role.” Their Ph.D. and their on-going research cemented their identity as academics.

Discussion

Certainly, teacher education needs reform but rather than impose draconian reforms that are conceived of by for-profit companies or ill-informed government officials, there needs to be what Kennedy (2016) calls incremental changes. Reforms need to be based on solid research (Ping et al., 2018); teacher educators need to participate in the discussion to determine overall goals for schooling (Goodlad, 1998; Dewey, 1916, 1938).

The stark contrast between the two approaches to teacher education—apprenticeship vs. a fulsome academic intellectual endeavor—show the incredible splintering of teacher education. Teacher education has long been criticized for its lack of uniformity (Shulman, 2005); however, the variance among programs has increased almost exponentially. Is “letting a thousand flowers bloom” a realistic and responsible approach to teacher education? Children are being taught by new teachers who have had vastly different preparation. In rapidly changing times, returning to an apprenticeship model of education defies logic and seems irresponsible. The scant research on alternative certification program (Anderson, 2019; Goldhaber, 2019) suggests these graduates are less prepared than those from full teacher education programs and as Zeichner and Conklin (2016) suggest they often do not remain in the teaching profession. It takes time to learn to be a teacher (regardless of the length of your teacher education program). Teacher educators need to be addressing many key topics: changing demographics of schools, systemic racism, international competition, globalization, climate change, technology-driven economy; and increasing disparities in wealth. Teacher trainees need excellent teacher educators because they will be teaching children who need the highest quality of education that prepares them for a rapidly changing world (e.g., COVID, dominance of social media platforms, politicization of news organization). Teacher educators cannot address this array of issues in a condensed program. They need to be working together to flesh out a pedagogy of teacher education that is powerful and appropriate for the current reality.

When selecting teacher educators, universities need to select teacher educators who have thought deeply about education, have engaged in graduate study, have unpacked their own personal and professional experiences, are willing to be part of an international network of teacher educators, have a wide-range of experiences, are flexible, and are willing to grow.

The conceptualization of teacher educators is essential (trainers or academics) because this has implications for their identity and practices. The presentation of the two studies of LTEs offered compelling evidence that they should be viewed as academics, researchers, and decision-makers. They need extensive pedagogical and intellectual skills to develop courses/modules that address pressing issues (e.g., advancing social justice). The work of the 58 LTEs presented demonstrate a thoughtful and deliberate approach to their teaching. In order to do this high level of teaching, they need preparation to be teacher educators (induction) and on-going support (professional development). Induction and professional development need to be based in research (Goodwin, 2012; Kosnik et al., 2014; Murray and Male, 2005) which delineates what teacher educators need to know and be able to do. Teacher educators who are plucked from classrooms to lead alternative certification programs need an opportunity to grow beyond their own experiences.

There is no evidence that government “reforms” have “worked.” How would they define success? If governments truly want to truly “improve” teacher education they must reallocate financial resources used on testing and supporting alternative certification programs to offering the kind of professional development (Boyd and Harris, 2010; Boyd et al., 2011) for teacher educators outlined by McPhail et al. (2018) and Czerniawski et al. (2018). This would be a clear sign they understand that teacher education is not an apprenticeship but is a complex intellectual/academic endeavor that requires teacher educators who devote serious attention to both theory and pedagogy. Governments of course have a place in education but it should be helpful, enlightened, and collaborative. Sending OFSTED officers to review school of education to check off boxes on a form is an insult and counterproductive to bettering practices. Is there any “proof” that OFSTED reviews have improved our workforce or citizenry? The money allocated for external reviews could be used much more wisely (e.g., support for teacher educators to be involved in international research teams). If governments engage in discussions with teacher educators it would be an opportunity for them to broaden their understandings of teacher education including setting realistic and timely goals for education. Their current myopic view is discouraging for teachers, children, LTEs, and teacher trainees. Teaching teacher trainees to deliver a script or simply use Levov (2010) strategies completely misleads them because it ignores the complex world of education. It is no wonder that new teachers often leave teaching prematurely or experience burnout. When the education being offered is not engaging what is being accomplished?

The question of whether teacher educators should be researchers has been shown to be almost absurd (Cochran-Smith, 2012). Of course, they need to do research on their teaching, on children, in the community, on their graduates, and on families as many of the LTEs did in this study. In turn, they must use their research to inform their teaching. This makes their courses/modules far more

relevant for the 21st century; teacher education courses based on research rather than on a whim or limited by the teacher educators' own classroom teaching experiences would be far more relevant. Being involved in research including international collaborations broadens the LTEs' world-view and increases their research skills. The whole issue of teacher educators themselves as researchers seems to have been overlooked by alternative certification programs because they have limited the work of teacher educators to be implementers and technicians. Before governments invest more heavily in alternative certification programs there needs to be research (done at arm's length) in a rigorous manner to determine if their talking points on their glitzy websites are valid (Bos and Gerdeman, 2017; Mitchell and Romero, 2010). Meanwhile, traditional university-based teacher education programs need to access research on alternative certification programs to determine if there is something to be learned from them. Working in silos or parallel paths undermines efforts.

Realistically, LTEs have very little political clout; however, their research and course construction which were a form of resistance must be continued. By using broad understandings of literacy and offering rich learning experiences they are preparing teacher trainees for the world which they and their students will face. The research on LTEs presented in this article provides examples for others on how to navigate multiple demands placed on them namely teaching and research. The courage shown by LTEs presented in these two studies is inspiring because they truly have worked hard to develop their courses, were focused on the teacher trainees' learning, and went to extraordinarily lengths to make teacher education engaging and relevant. They are interested in teacher education that is not driven by neoliberal reforms of for-profit companies. It is time for courageous leadership. As Roberto in the UK states:

I use three words when I am talking about teaching as a quite basic level with the students, but I believe I bring as well. Its purpose, passion, and empowerment. Those are three key words for me, which I try and show when I teach. I teach with a passion, and you have to have passion with your subjects. There must be a purpose that we're teaching children. Children need to know the purpose, and the purpose is not good enough to be, because the government said or because it's the next objective. And then, we're empowering, I empower the students, and the students have to empower children within their classrooms.

Appendix one

Methodology

For both studies, invitations to participate in the study were sent to a small group of LTEs. This led to "snowball sampling" whereby some LTEs who had accepted the invitation then suggested a colleague who might be relevant for the study. This led to 58 participants who were interviewed using a semi-structured format which took approximately 60–90 min. The same questions were asked of all participants, but probe questions were posed and additional comments were welcomed. Most of the questions were open-ended in that they sought more than a yes/no responses or simple factual answers. Interviews were done either face-to-face or on Skype and were audio-recorded and transcribed.

Interview questions included those on: background (e.g., timeline of turning points, topic of Ph.D. research, experience as a classroom teacher; influences on your current practice; qualities of a teacher educator; academic community; framework and goals for their literacy course(s); pedagogies used and reasons for using them; assignments and readings; and equity and diversity.

Much of the methodology was qualitative as defined by Merriam (2009) and Punch (2014). Qualitative inquiry is justified as it provides depth of understanding and enables exploration of questions that do not on the whole lend themselves to quantitative inquiry. It opens the way to gaining entirely unexpected ideas and information from participants in addition to finding out their opinions on simple pre-set matters. A modified grounded theory approach was used, not beginning with a fixed theory but generating theory inductively from the data using a set of techniques and procedures for collection and analysis.

For data analysis qualitative software NVivo was used. The first level of analysis, "open coding" was used to examine properties of the data by identifying salient words and phrases, relating to the research questions and any other category or theme, which were emerging. To initially generate open codes, the clearest transcripts were analyzed; they were "richly descriptive" and had few disruptions (e.g., phrases transcribed as "XXX" because transcriber could not hear what was being said). During the open coding process, transcripts were first coded by hand. Then, all transcribed interviews were imported into NVivo12 software for analysis "to allow rigorous interrogation of the data". 164 nodes were including sub-nodes were developed.

Approximately 32 nodes (themes) that related to teacher educators' journeys. As the analysis progressed, key findings were identified and refined—adding some and deleting or merging others—through "constant comparison" of the interview transcripts. Through axial coding connections were identified across the nodes. Queries were run to determine connections between goals for literacy courses with pedagogy.

The findings are divided into three sections: goals for their courses; place of and doing research activity; and identity. These were chosen because they address the topics raised in Part One.

Introduction: why study our own practices?

Why should a teacher or teacher educator study personal teaching practices?

Many answers to this question can be found in the extensive literature of action research. The focus on self-study of teacher education practices dates to the early 1990s. There is very little in the teacher education literature about the fact that when teacher educators are teaching those who are learning to teach, they are modeling teaching as they educate about how and why we should teach in particular ways. In our view, this is one of the most compelling reasons why teacher educators should study their own teaching practices. Tom recalls well the day that a teacher candidate—the term we use here for those studying in a preservice teacher education program—asserted that professors teaching in a faculty of education should be the best teachers at the university (and he felt that this was not the case in his program).

In 2020, Self-Study of Teacher Education Practices (S-STEP) is approaching 30 years as a named field of research. In addition to countless academic publications and conference papers, the field has its own journal (*Studying Teacher Education*) begun in 2005 and has published not one but two international self study handbooks of teaching and teacher education practices (Loughran et al., 2004; Kitchen et al., 2020).

How do teachers and teacher educators learn to teach?

To many students, teaching looks easy (Labaree, 2000); first-year teachers soon discover otherwise. To many teachers, teaching teachers looks easy (once you have mastered teaching in a school). But there is much to teaching teacher candidates that is not obvious to those who have never done it. Lortie (1975) offered an essential insight when he coined the now-famous phrase, "apprenticeship of observation" (p. 61). In essence, every student learns to teach by observing numerous teachers over more than 15 years of experience in the student role. In our analysis, one key point is that students have learned what teachers do but they have not learned how teachers think or why they teach as they do. The apprenticeship is partial and incomplete in critical ways. Lortie put the problem clearly when he observed that all students, including those in pre-service teacher education programs, typically lack a great deal of information about why teachers act as they do:

Students... are not privy to the teacher's private intentions and personal reflections on classroom events. Students rarely participate in selecting goals, making preparations or postmortem analysis. Thus they are not pressed to place the teacher's actions in a pedagogically oriented framework. (p. 62)

It is improbable that many students learn to see teaching in an ends-means frame or that they normally take an analytic stance toward it. Students are undoubtedly impressed by some teacher actions and not by others, but one would not expect them to view the differences in a pedagogical, explanatory way. What students learn about teaching, then, is intuitive and imitative rather than explicit and analytical; it is based on individual personalities rather than pedagogical principles. (p. 62)

Lortie continues by explaining how an apprenticeship of observation falls far short of a true apprenticeship:

The student's learning about teaching, gained from a limited vantage point and relying heavily on imagination, is not like that of an apprentice and does not represent acquisition of the occupation's technical knowledge. It is more a matter of imitation, which... becomes tradition. It is a potentially powerful influence which transcends generations, but the conditions of transfer do not favor informed criticism, attention to specifics, or explicit rules of assessment. (p. 63)

Every teacher and teacher educator has experienced thousands of hours of observation of what teachers do. Against this unanalyzed but powerful background, a teacher education program offers a much smaller number of hours in which teacher educators present the content of educational theory and research as well as practical advice, typically without addressing how much has already been learned about teaching. This is not only a challenge for those learning to teach. It is also a challenge for teacher educators who may have extensive experience in both school and university contexts but who have never analyzed how their teaching habits were shaped by experience. Against this background reality, we see self-study of teacher education practices as critical for all teacher educators in all cultures.

When Vick (2006) provided an historical analysis of the place of the practicum in teacher education in England and Australia since 1900, he reported that despite decades of reports and calls for change, the *assumptions* underlying teacher education practices have shown little change over time:

The analysis of the history of the practicum in teacher preparation indicates how firmly contemporary proposals are embedded within the framework of assumptions and approaches that have shaped teacher education for over a century. (p. 181)

Our own self-study explorations of assumptions underlying our own teaching confirm the significance of Vick's message. We must study not only our practices but also the assumptions about learning implicit in those practices as we seek to improve our teacher education practices.

Context

We write as teacher educators located in two different countries with distinctly different languages and educational cultures. Our critical friendship has evolved from an initial meeting in Santiago in 2010; Tom has since visited Chile another 16 times, while Rodrigo has visited Canada four times. As we write in 2020, we share a strong commitment to the importance of teacher educators studying their own practices in their teacher education classrooms and in practicum supervision. Tom was a founding member of the Self-Study of Teacher Education Practices (S-STEP) special interest group within the American Educational Research Association in 1993. Rodrigo has developed a strong commitment to teacher educators' learning from their own experiences and in introducing the concept of self-study to teacher educators in a range of universities in Chile. Since 2015, Rodrigo has collaborated with the Chilean office of the Organization of Spanish-American States (Organización de Estados Iberoamericanos, OEI) for that purpose.

Outline of the argument

Authors' instructions for this article included the following statement: "This edition aims to include contributions from traditions, regions and people that have in the past been marginalized, promoting debates about the global politics of knowing, learning, teaching and governing." Authors were also invited to include a summary of recent personal research. In this article, we are guided by both suggestions. In the spirit of a more global perspective, we explore the challenges of introducing a concept that has evolved in one culture into a quite different culture. In keeping with the international character of the encyclopedia and this entry, three tables provide translations into Spanish for the benefit of Spanish-speaking readers. One of our first challenges was recognizing that the literal translation of *self-study* into Spanish as *autoestudio* is inappropriate and misleading; we use *self-study* in both languages as shorthand for self-study of teacher education practices.

We begin with a section about self-study as a methodology for improving the quality of teacher education. This is followed by further discussion of self-study and how it begins. To illustrate how self-study might begin, we provide personal accounts of our own experiences of self-study. Being more recent, Rodrigo's account is more detailed and includes a bilingual account of the impact of self-study on his perspectives as a teacher educator. Not long after learning about self-study, Rodrigo found support for creating

a network that would introduce other teacher educators in Chile to self-study, and details are provided in a second bilingual presentation of his learning from experience. The argument continues with a discussion of critical friendship based on what we have learned together from our extended period of friendship as teacher educators. The argument closes with some additional resources for exploring self-study and with a summary and conclusion.

Self-study as a methodology for the improvement of teacher education

Tom retired in 2019 after 42 years as a teacher educator in Canada; his passion for teacher education continues. As of this writing in 2020, Rodrigo has 27 years of experience as a teacher educator, including several years as Dean of a Faculty of Education in Chile. In Canada and in Chile, as in many other countries, appeals for the improvement of teacher education seem ever-present, yet teacher education continues to qualify as a field in which “the more things change, the more they stay the same,” or as Donald Schön once put it, “the more things stay the same, the more you know that there are deliberate efforts being made to keep them that way” (Unpublished lecture, Queen’s University, October 1984).

Even when pressed, many teacher candidates find it difficult to describe how and why they went about selecting goals, preparing for their teaching and then analyzing the effects of their teaching. As a case in point, pre-service candidates may seem to understand what we refer to as *reflection* but they are often challenged when trying to analyze and develop new frames for what they are doing in the practicum classroom. The innovative teaching approaches that teacher educators urge prospective teachers to consider and that they believe could improve what happens in schools have emerged from and are supported by the extensive research over the last 40 years on how people learn. Research tells us that people learn best when they are active, challenged and engaged. Research reminds us that all students come to us with prior knowledge in various subject areas. The largely invisible apprenticeship of observation generates the prior knowledge and beliefs that teacher candidates bring with them, but we as teacher educators are not necessarily adept at recognizing, exposing and responding to that knowledge and those beliefs and adapting our teaching accordingly. As already noted, we have probably not done the same ourselves.

We risk suggesting the possibility that teacher educators themselves may not understand fully why they teach as they do and what the full range of effects of their teaching may be. “Learning how to think and act in ways that achieve one’s intentions is difficult, particularly if knowledge is embedded in the practice itself.” (Darling-Hammond, 2006, p. 37). Like teachers, teacher educators do learn from the experience of their teaching, but the quality of learning from experience is not easily evaluated. Hence the need for and the importance of a methodology for studying one’s own practices as a teacher educator. Self-study of teacher education practices is not a study of the self; rather, it is the study of the teacher education practices of the individual who enacts those practices.

Consider the following critique of the state of teacher professional development and also consider whether similar comments might be made about the preparation of teacher educators to work in a field that is uniquely different from teaching the content of the school curriculum:

The typical preservice program is a collection of unrelated courses and field experiences. Most induction programs have no curriculum, and mentoring is a highly individualistic process. Professional development consists of discrete and disconnected events. Nor do we have anything that resembles a coordinated system. Universities regard preservice preparation as their purview. Schools take responsibility for new teacher induction. Professional development is everybody’s and nobody’s responsibility.

Feiman-Nemser (2001, p. 1049).

Teacher education is far more complex than it is often taken to be, if we consider not only the short period of professional preparation relative to other professions, but also the challenge of teaching someone how to do the very activity that one is engaged in with them. Labaree (2000) described the complex challenges of teaching in these memorable words:

We ask teacher education programs to provide ordinary college students with the imponderable so that they can teach the irrepressible in a manner that pleases the irreconcilable, and all without knowing clearly either the purposes or the consequences of their actions. Is it any wonder that these programs are not seen as smashing successes?... In addition, they face a situation in which the profession of teaching is generally seen to be relatively easy. And this perception is not simply characteristic of the untutored public; it is also endemic among teacher candidates. (p. 231)

When self-study of teacher education practices arrived on the landscape of teacher education, it was with a strong sense that teacher educators themselves should look within. We too learned from an Apprenticeship of Observation, for “We teach as we were taught” tends to be as true for teacher educators as it is for teachers and those learning to teach. One of the first observations that teacher candidates may make in their education courses concerns the teacher educator who uses one teaching method (often transmission-based) while advocating for another (often inquiry-based). If teacher educators cannot “practice what they preach” and enact their own values and understandings, what incentive is there for teacher candidates to attempt to do so? Teacher educators and the programs in which they teach are unlikely to excel in the preparation of teachers without considering their own development and how they arrived at and might improve their current practices.

What is self-study and how does one begin?

In the context as teacher education, self-study is research in one's own setting of practice to understand and reduce the gap between our good intentions as teacher educators and the actual learning of pre-service teacher candidates. In our view, three related steps are essential:

1. Self-study requires being willing to make fundamental changes in one's perspective on personal teaching practices. This includes openness to surprising, puzzling and unexpected events that can lead to *reframing* and what we call *repracticing*—a term that parallels reframing and reminds us that new ways of viewing practice should lead to new ways of enacting practice.
2. Self-study requires seeing those learning to teach not as empty vessels to be filled with knowledge they lack but as experienced students with extensive but incomplete and potentially misleading knowledge of teaching that must be explored and reinterpreted as part of becoming a teacher.
3. Self-study requires recognition that the teaching practices a teacher educator models for teacher candidates can send messages more powerful than the content knowledge of teaching being developed. Thus it is important for the self-study researcher to create and lead in-class opportunities for discussing and explaining the rationales for specific ways of teaching

Broadly speaking, self-study begins with discomfort and dissatisfaction with the view that learning to teach is a straightforward matter of learning how to teach by being told and then moving to practicum settings to practice what one has already learned. Self-study becomes a powerful research strategy when a teacher educator is willing to explore the complexities of learning to teach in the context of exploring simultaneously the complexities of one's own teaching. Self-study begins by attending to events, experiences and interactions that had previously been ignored, not because they were irrelevant but because they were taken for granted and accepted as familiar and unproblematic: "You can't fix what you can't see." In the next two sections we present personal accounts of our own self-study experiences.

Tom's personal account of self-study of practice

When Tom began to teach pre-service science teachers in 1977, it had been 10 years since he had taught physics in a school. He had just worked for three years with experienced teachers, who had shown him that reducing the amount of talking they do in class was quite challenging. A reduced amount of talking was not what preservice teachers expected, and he quickly began to listen in various ways to their expectations. He also observed many of his students in their practicum placements, where he saw that the practicum is not the place where they put what they had recently been taught into practice. Schön's (1983) *The Reflective Practitioner* offered the perspective he needed to move him forward. Three lectures by Schön at Queen's University in 1984 focused his attention on reflection-in-action—reframing in response to surprising, unexpected or puzzling comments by students.

As the word "reflection" swept into teacher education programs everywhere, Tom had to find ways to have his students focus on "reflection-in-action" in the practicum and away from reflection about issues raised in program classes. From 1984, he and colleague Hugh Munby used Schön's (1983) perspectives on reframing and reflection-in-action in several nationally funded research projects to better understand how individuals learn to teach. It was perhaps inevitable that he should apply the same perspectives to his own teaching. Tom's entry into self-study was pushed forward by returning to the secondary school physics classroom in 1991 and again in 1992 to teach one 75 min physics lesson every day for a full semester after a 25-year absence from the secondary school.

Self-study has enabled me to understand my teaching and my students as never before. When the term "self-study" was gaining attention and interest, I had taken myself back to the secondary school physics classroom to better understand the work I was helping people learn. Now I had a better conceptual framework for viewing both my own development as a teacher and the development of those learning to teach. I also began teaching an M.Ed. course in action research, and through successes and failures, self-study became the key to better understanding.

Hamilton et al. (1998, p. 3).

I can now credit self-study with enabling me to develop the following pedagogical principles that were present in my teaching in 1997–1998 but very absent in 1992–1993.

- Build on and trust in their extensive early teaching experiences.
- Build a community in my classroom.
- Every class includes a significant experience, with implications for how we teach.
- Gather backtalk [students' comments about the quality of their learning] often and distribute it freely.
- Identify a few central themes, post visual cues to each, and link to them as often as possible.
- Replace lectures with notes on a website; use classroom time for experiences and discussions.
- Encourage and reward self-directed learning.
- At the end of the course, ask students what they think you learned from them (Hamilton et al., 1998, p. 3).

As critical friends, Tom and Rodrigo try to remind each other of their previous work. Rodrigo recently suggested that Tom include the preceeding statements (see Table 1) that have emerged from his efforts to study his own teaching of future teachers. They represent his advice to himself and to others who might be interested.

Table 1 Suggestions for teacher educators' relationship to those they teach.

Go easy on the issue of attendance. They pay for our classes. If your teaching doesn't attract them, low attendance will tell you that you need to change, unless you command attendance. A student in a chair is no guarantee of any learning happening.	Con el tema de la asistencia. Ellos pagan nuestras clases. Si su enseñanza no los atrae, la baja asistencia le dirá que necesita cambiar, a menos que usted exija la asistencia. Un estudiante desinteresado no es garantía de que algo suceda más en el futuro.
Teacher candidates are adults, not children. Interact with them as adults; for years it was common in this building to refer to them as kids. They are younger than we are, and most lack experience outside schools, but they deserve our respect.	Los candidatos a profesores son adultos, no niños. Interactúe con ellos como adultos; por años fue común en estos espacios referirse a ellos como niños. Ellos son más jóvenes que nosotros, y tienen menos experiencia fuera de las escuelas, pero ellos se merecen nuestro respeto.
Listen to TCs' experiences in your first class after each practicum placement. Find out how their practicum experiences have changed their sense of what they need to learn from you in your course.	Escuche las experiencias de los candidatos a profesores cuando cuenten sus experiencias al regresar de su práctica. Entérese como sus experiencias de práctica han cambiado el sentido de lo que ellos necesitan aprender de Ud.
I would venture that 50% of what TCs learn from you involves what they learn by watching you teach and experiencing its impact on their learning. They are here to learn to teach, and so they watch our teaching moves far more closely than they watched previous professors. They are frustrated by teaching moves that contradict our words about teaching. Our words and our tune MUST go together consistently.	Me atrevería a decir que el 50% de lo que los candidatos a profesores aprenden de usted implica lo que aprenden al verlo enseñar y experimentar su impacto en el aprendizaje de ellos. Están aquí para aprender a enseñar, y por lo tanto observan nuestros movimientos de enseñanza mucho más de lo que observaron a profesores anteriores. Se sienten frustrados por los movimientos de enseñanza que contradicen nuestras palabras acerca de la enseñanza. Nuestro discurso y nuestra acción DEBEN ir juntos de manera consistente.
Mind the experience gap. We have teaching experience and they do not. It is very difficult to talk over, around, under or through that gap. People with experience think differently about teaching (as in not needing formal lesson plans, etc.) that those who are just beginning (Russell, 2018).	Tenga en mente la brecha de experiencia. Nosotros tenemos experiencia y ellos no. Es muy difícil hablar por encima, alrededor, debajo o a través de esa brecha. Las personas con experiencia piensan de manera diferente respecto de la enseñanza (como no necesitar planes formales de lecciones, etc.) que aquellos que recién están comenzando

In the 2018–2019 academic year, Tom conducted a final self-study of his last year as a teacher educator, introducing three new practices and studying their effects. The practices included replacing *theory* and *practice* with *book knowledge* and *craft knowledge* (following Hagger and McIntyre, 2006), modeling cognitive principles identified by Willingham (2009), and using the last 15 min of every 2-h class for a metacognitive conversation about what we had just learned and how we learned it. With ethical clearance from the university, all 14 students agreed to participate and provided valuable comments on the impact of those new practices on their learning (Russell et al., 2020). Self-study generated a memorable conclusion to a teacher educator's career.

Rodrigo's personal account of self-study of practice

In 1992, a teacher educator whom Rodrigo was assisting at the time asked him, "Have you thought about what working in teacher education means?" and thus began his efforts to answer that question. As he came to know other teachers, Rodrigo understood that knowledge of the subject was not enough for the students, and he began to pay more attention to his students' comments and to questions such as "Teacher, why did you do that? How do you know what he is going to do? How did you know when to respond?" Getting in touch with the questions and concerns of the students, as well as paying attention to his own practices, allowed him to discuss what until then was the mantra: "One can't teach what one doesn't know." Meeting Tom and developing a critical friendship encouraged actively listening to students' questions, clarifying his decisions for his students, and continuously analyzing his own practices with another teacher educator. The self-study perspective has also allowed him to understand that analysis of his own practices, and those of future teachers, refers not only to the method used but also to the assumptions that underlie teaching actions. Those who do not make themselves explicit in front of others will not have the opportunity to better understand their teaching and to model for future teachers the methods and importance of that understanding.

Self-study has allowed Rodrigo to understand the following points:

- Future teachers have a lot of experience as observers of teachers, so they need spaces for exploration in order to identify the assumptions that accompany their observations of teachers.
- I need to promote spaces for real practice by future teachers, not time for more observations.
- To the extent that I make my professional decision-making explicit in my classes, I can enter into better interaction with the students, allowing them in turn to give an account of the ways in which they learn.
- To the extent that I generate instances for listening to the voice of my students, I can better understand the decisions that accompany their practices.

- To the extent that a climate of trust and professional exchange is generated, it is possible to collect more definitive evidence of their learning than through a test. For example, asking for anonymous tickets-out-of-class about their learning has allowed me to collect valuable information regarding the quality of their learning, and this allows me to analyze their learning in relation to my practices.
- Observing a critical friend's practices helps me to identify the assumptions that have guided my professional practices.

The impact of self-study on Rodrigo's perspectives

In [Table 2](#), Rodrigo describes his interests in self-study, how his practices have changed since he became interested, and why he believes self-study of teacher education practices could be valuable to educators and education in Chile.

REDFORMA: introducing self-study to another culture

In an article prepared for an international encyclopedia, it is essential to address the issue of introducing an innovation into other cultures. Self-study of Teacher Education Practices appears to have spread relatively easily across many English-speaking countries and it has attracted interest in countries where teacher educators are comfortable working in English. It is important to note that the official S-STEP membership is steady but small and self-study is a minor but significant methodology in the educational research literature. It is always necessary to pose questions about cultural similarities and differences before attempting to introduce self-study into another academic culture as an unfamiliar research methodology and literature.

At Rodrigo's initiative, the introduction of self-study of teacher education practices into the academic culture in Chile began in 2015 and is continuing to attract interest. The initial experiences were understandably hesitant but by 2020 they have evolved and publications of self-study research are beginning to appear. [Table 3](#) provides an overview of the first five years of experience; additional details are provided by [Fuentelba et al. \(2017, 2020\)](#).

The preceding accounts of our own self-studies and of the challenges of introducing self-study into another culture are intended to illustrate the many different ways in which self-study of teacher education practices can add important new dimensions to the work of teacher educators, potentially leading to improvement not only in teacher education classrooms but also in teacher education programs. We turn next to the importance of critical friendship in self-study.

The role and value of critical friendship in self-study

Even though self-study is a study of one's own actions as a teacher educator, it is not an activity best done on one's own. [Loughran and Northfield \(1998\)](#) explained the rationale for and the importance of collaboration during self-study:

The learning in self-study is intensely personal, but self-study itself requires collaboration.... In this approach, the intensely personal aspects of the study that might otherwise be simply accepted without challenge or scrutiny are able to be professionally and constructively challenged from within the study itself. (p. 14)

There is always a danger that individuals will interpret situations in ways that reinforce existing perceptions. Genuine study of classrooms is associated with a willingness to consider alternate frames of reference, and colleagues are an important source of ideas and support as the teaching and learning are reviewed. (p. 16).

While some self-studies are carried out in isolation and privacy, it is typically both important and highly productive to identify a collaborator for on-going analysis of one's questions, perspectives, and data during self-study research.

Critical friendship is at the heart of our relationship as two teacher educators working across cultural boundaries. That friendship is centered on trust and a shared desire to help each other develop not only better actions in the teacher education classroom but also better understanding of the assumptions implicit in our actions. Although we are physically separated by a 10 h flight and a potential language barrier, mobile phones and Wi-Fi networks mean that we can be as close as the house next door, thanks to Rodrigo's facility in English. Using a combination of Skype and video recordings, Rodrigo observed most of Tom's physics methods classes in the four-year period 2015 to 2019; he also visited Tom's classes in person for one week in each of those four years. Tom made 10 visits to Chile in the same period and attended several of Rodrigo's classes and interacted with some of his students.

The exchange of visits to each other's classes inspired numerous conversations about teaching practices and provided insights into each other's educational cultures, both pre- and post-secondary. While the differences seemed dramatic at first, we soon realized that at a deeper level the differences were more subtle. In Chile, the basic pattern is that teachers talk and students listen. In Canada, as in other English-speaking contexts, that is still a basic pattern, although there are many superficial variations that can suggest

Table 2 Rodrigo's perspectives on self-study.

<i>¿Por qué mi interés en self study?</i>	<i>Why am I interested in self-study of teacher education practices?</i>
El Self-study permite centrarse en las propias prácticas de enseñanza y, mediante un examen honesto y la colaboración con otros, promover el cambio de valores profesionales y creencias personales con respecto a cómo aprendemos y enseñamos. También el Self-study permite un cuestionamiento más profundo de los supuestos subyacentes a nuestras propias prácticas de enseñanza. Esto tendría un efecto significativo en aquellos que forman parte de un entorno profesional: futuros profesores y colegas. El desarrollo de un Self-study no se centra en teorizar, sino que tiene como objetivo replantear los supuestos en los que se basan las prácticas y cómo las prácticas pueden cambiar y reinterpretarse en un contexto de aprendizaje. El Self-study es una actividad colaborativa, realizada en intercambios profesionales sobre supuestos y cambios en la práctica entre los participantes. El Self-study ve a los futuros profesores como profesionales activos con voz y no como receptores vacíos del proceso de aprendizaje que aceptan acríticamente lo que les dice su profesor	Self-study permits one to focus on one's own teaching practices and, through an honest examination and collaboration with others, to advance the change of professional values and personal beliefs with respect to how we learn and teach. Self-study also permits deeper questioning of the assumptions underlying our own teaching practices. This would have a significant effect on those who are part of one professional environment—future teachers and colleagues. The development of a self-study is not focused on theorizing but aims to reframe the assumptions that one's practices are based on and how practices can change and be reinterpreted in a learning context. Self-study is a collaborative activity, conducted in professional exchanges about assumptions and changes in practice between the participants. Self-study sees future teachers as active professionals with voice and not as empty recipients of the learning process who accept uncritically what their teacher tells them.
¿Cómo han cambiado mis prácticas? Al cederles la voz a los futuros profesores, puedo crear un ambiente de confianza profesional para el intercambio de prácticas. Soy más consciente de la importancia de explicar a mis alumnos las razones que enfatizan mis prácticas de enseñanza. Esta es una manera de modelar el proceso de aprender a pensar como maestro. Compartir mis prácticas con un amigo crítico ha sido fundamental, porque he podido aprender lo siguiente: ver mis propias prácticas desde diferentes perspectivas, desafiar mis suposiciones, hacerme nuevas preguntas y desafiarme a mí mismo a cambiar mis prácticas de enseñanza. El proceso de reenmarcamiento [reframing] de mis prácticas a nivel de supuestos respecto a enseñar y aprender no sólo tiene importancia a nivel declarativo, sino que también implica asumir riesgos con nuevas prácticas (repracticing).	How have my practices changed? By giving voice to future teachers, I am able to create an environment of professional confidence for the exchange of practices. I am more aware of the importance of explaining to my students the reasons that underlie my teaching practices. This is a way of modeling the process of learning to think like a teacher. Sharing my practices with a critical friend has been central, because I have been able to learn the following: to look at my own practices from different perspectives, to challenge my assumptions, to ask myself new questions, and to challenge myself to change my teaching practices. The process of reframing my practices in terms of assumptions about teaching and learning not only has significance at a declarative level but also implies taking risks with new practices. We call this repracticing, as it follows reframing.
¿Porqué se debe introducir el Self Study en Chile? En la formación de docente, en Chile, la tradición predominante asume que la práctica docente es un lugar para aplicar lo que previamente se ha aprendido en las aulas universitarias. Debido a que la práctica ha sido vista como un espacio para replicar los modelos previamente enseñados en la universidad, debemos replantear nuestros supuestos para ver que la práctica docente es un escenario para el propio aprendizaje y no sólo un lugar para replicar los modelos de otros. Porque en Chile, la concepción de la complejidad de los procesos de enseñanza asume que un docente novato debe abordar el proceso de pasantía de manera muy paulatina a pesar de haber observado a los docentes durante muchos años. Por lo tanto, las actividades en la escuela comienzan primero con la observación, luego se expanden a pequeñas intervenciones de enseñanza y, mucho más tarde, se hacen responsables de una clase completa.	Why should self-study be introduced in Chile? In teacher education in Chile the prevalent tradition assumes that teaching practice is a place to apply what has been learned previously in university classrooms. Because practice has been seen as a space for replicating the models previously taught in the university, we must reframe our assumptions to see that teaching practice is a setting for one's own learning and not just a place for replicating the models of others. Because in Chile the conception of the complexity of the teaching processes assumes that a novice teacher must approach the internship process very gradually despite having watched teachers for many years. Thus activities in school begin first with observation, then expand to small teaching interventions, and much later taking responsibility for a complete class.

otherwise. Over the last 20 years, Tom's practices have emphasized listening to his students (Cook-Sather, 2002) and Rodrigo found that to be an intriguing practice that he has initiated with his own students. While students may at first respond hesitantly, they soon realize that he is serious about listening to them and move on to embrace the openness that develops.

Critical friendship should be mutual

As Loughran and Northfield (1998) suggested, it is often recommended that a teacher educator identify a critical friend to assist with a self-study and many articles have been published to illustrate the value of such a friend. Our experience of sharing our teaching as

Table 3 A bilingual account of introducing self-study in Chile.

En 2015 Rodrigo compartió su creciente interés por el Self Study de las prácticas en la formación de profesores con Carolina Hirmas de la Oficina de Santiago de la Organización de Estados Iberoamericanos (OEI). La idea inicial fue crear un espacio alternativo para los formadores de formadores donde compartieran sus prácticas y otras inquietudes. Este espacio se denominó REDFFORMA (Red de Formadores de Formadores; http://www.redfforma.cl). En 2016, se publicaron una serie de artículos de Self Study traducidos del Inglés al Español, para apoyar la nueva red. En Chile, los temas más comunes entre los formadores de profesores dicen relación con los cambios en el currículum de formación y en el apoyo a los futuros profesores relacionado con aspectos relacionados con la teoría y la investigación más que con la práctica. Por lo general, no hay oportunidades para discutir las prácticas formativas o el papel del formador como modelador de prácticas docentes prometedoras. Rodrigo y Carolina comenzaron organizando reuniones entre formadores de futuros profesores que trabajan como supervisores de prácticas. En estas reuniones se compartían sus prácticas explorando preguntas planteadas por Tom, amigo crítico internacional del grupo. Algunas preguntas abordadas: * ¿Porqué quiere cambiar sus prácticas de supervisión? * ¿Qué aspectos de su práctica ha cambiado o quisiera cambiar? * ¿Cómo han respondido sus estudiantes cuando ha introducido una o más prácticas nuevas? * ¿Qué evidencia está recolectando de sus estudiantes? Preguntas como estas animaron a los miembros de REDFFORMA a centrarse en sus prácticas. En un inicio, se constató que es más fácil decirle a los futuros profesores que es importante analizar sus prácticas que analizar las propias prácticas. Los esfuerzos iniciales en el análisis de las prácticas estuvieron más centrados en perspectivas teóricas. Con el apoyo de la OEI, se convocó a la realización de Self Studies colaborativos que involucraran a formadores de docentes de diferentes universidades. Tres proyectos obtuvieron el apoyo de la OEI y Rodrigo y Carolina actuaron como amigos críticos externos de los grupos. En la medida que se trabajaba para hacer de las prácticas formativas el foco central, los formadores de formadores se enfrentaron a tres importantes desafíos: 1. Compartir no sólo las prácticas sino que también los supuestos orientadores de dichas prácticas. 2. Escuchar las voces de los estudiantes en tanto miembros de una comunidad y no como meros receptores de nuestro conocimiento. 3. Ver a Rodrigo y Carolina más como amigos críticos externos que como expertos dando consejo a los grupos. En la medida que crecía el interés entre formadores de formadores chilenos, se convocó a una segunda oportunidad para presentar propuestas. Eso permitió que Rodrigo y Carolina ajustaran su enfoque en función de los tres importantes desafíos identificados. Tom estuvo presente en una gran reunión en que los grupos compartieron sus principales puntos de vista. Esto permitió en 2020 el desarrollo de un número especial de la <i>Revista Iberoamericana de Educación</i>, 82(1) https://rieoei.org/RIE/issue/view/Self_Study Para el período 2020–2021 REDFFORMA apoya a tres nuevos grupos, con nuevas universidades, incluyendo dos formadores de formadores internacionales, una de Colombia y otra de España. Esta situación agrega nuevos desafíos para el Self Study, y específicamente para los amigos críticos, ¿Cómo en el proceso ellos desarrollarán un entendimiento compartido respecto de lo que significa ser formador de futuros profesores?, ¿Cómo cada grupo logrará una sintonía fina respecto del entendimiento sobre sus prácticas si cada uno tiene culturas y significados diferentes.	In 2015 Rodrigo shared his growing interest in self-study of teacher education practices with Carolina Hirmas at the Santiago office of Organización de Estados Iberoamericanos (OEI). The initial idea was to create an alternative space for teacher educators to share their practices and other concerns. That space is named REDFFORMA (Red de Formadores de Formadores: Network of Teachers of Teachers; http://www.redfforma.cl/). In 2016, self-study reports translated from English to Spanish were published to support the new network. In Chile the typical topics among teacher educators include changes in the teacher education curriculum and in support for future teachers related to theory and research rather than to practice. Usually, there are no opportunities to discuss teacher education practices or the role of the teacher educator in modeling promising teaching practices. Rodrigo and Carolina began by arranging meetings of teacher educators who work as practicum supervisors. At these meetings, they would share their practices by exploring questions posed by Tom as the group's international critical friend. Questions included the following: • Why do you want to change your supervision practices? • What aspects of practice will you change or have you changed? • How did your students respond when you introduced one or more new practices? • What evidence are you collecting from your students? Questions such as these encouraged members of REDFFORMA to focus on their practices. At first, they realized that it is easier to tell future teachers that it is important to analyze classroom practices than it is to analyze their own practices. The initial efforts to analyze practices were focused on theoretical perspectives. With support from OEI, a call was issued to develop collaborative self-studies involving teacher educators in different universities. Three projects obtained initial support from OEI and Rodrigo and Carolina served as external critical friends to the groups. As they worked to make their teacher education practices their central focus, the teacher educators encountered three significant challenges: 1. To share not only our practices but also their underlying assumptions 2. To listen to students' voices as members of a community rather than as recipients of our knowledge To see Rodrigo and Carolina more as external critical friends than as experts giving advice to the groups As interest in self-study grew among Chilean teacher educators, a second call for proposals was issued. This provided an opportunity for Rodrigo and Carolina to adjust their approach based on what they learned as they identified the three significant challenges. Tom was present for a large gathering in which groups shared their principal insights. This led in 2020 to the development of a special issue of the OEI journal, <i>Revista Iberoamericana de Educación</i>, 82(1): https://rieoei.org/RIE/issue/view/Self_Study For the period 2020–2021 REDFFORMA is supporting three new groups, including more universities and two international teacher educators, one from Colombia and one from Spain. This situation adds interesting new challenges, particularly for the critical friends: How will each group develop shared understanding of what it means to be teacher educator? How will each group fine tune its understanding of teacher education practices if different cultural contexts bring different interpretations of practices?
---	--

we study our own practices now leads us to recommend that the ideal critical friendship in self-study involves two teacher educators studying their own practices simultaneously, preferably over an extended period of time. Together, Rodrigo and Tom have prepared four conference presentations based on their shared self-studies (Fuentelba and Russell, 2014, 2016, 2020; Fuentelba et al., 2018). Tom has participated in several more self-studies involving critical friendship (Schuck and Russell, 2005; Martin and Russell, 2016; Martin, 2017; Martin and Russell, 2018; Russell, 2017).

The advantages of mutual critical friendship may not be obvious at first; adjusting to a developing critical friendship can itself be a challenging experience. Persistence pays rich dividends. Rodrigo and Tom have found that collaborating to construct this encyclopedia entry has been yet another remarkable and positive experience. If seeing teaching as telling (with its implicit assumption that listening is learning) is imperfect, what are the alternatives? Perhaps teaching can be seen in part as *asking good questions* (with its implicit assumption that a question stimulates a more productive cognitive activity). Reviewing our collaborative writing experience, we see that we have freely asked each other good questions. Perhaps a key to critical friendship involves asking good questions—questions that we both want to explore and for which we genuinely want to hear the other's response. When both critical friends are engaging in self-study, the flow of good questions in both directions can be particularly productive. At all times, respect for the knowledge and experience of the other is crucial.

Resources for learning more about self-study of teacher education practices

Major sources of further information about and examples of self-study are the two international handbooks (Loughran et al., 2004; Kitchen et al., 2020) and issues of *Studying Teacher Education*. In addition, there have been 13 international self-study conferences held biennially at Herstmonceux Castle in the UK since 1996; the proceedings of all 13 conferences are available at <https://www.castleconference.com/conference-history.html>. In Spanish we recommend Russell et al. (2016).

Summary and conclusion

With a history of more than 25 years (since 1993), self-study of teacher education practices has achieved considerable momentum. Two editions of an international handbook, a journal with a 15-year history and 13 international conferences with published proceedings provide a great deal of background and guidance for teacher educators who wish to better understand their own teaching practices and their impact on those learning to teach. The methodology set out by LaBoskey (2004) has stood the test of time. While self-study depends on the willingness of one teacher educator to examine not only personal practices but also the underlying assumptions, it is often much more productive and informative when conducted with a colleague, often referred to as a critical friend.

It is common to urge others to learn from experience. Learning from our own experiences is a challenging process, but it offers important opportunities to rethink how we educate future teachers, particularly in a field that has shown stability over time. Lortie's (1975) work suggests that much of what we know about teaching has been learned by observation of those who have taught us. We may have learned a great deal of education theory, but theory is rarely put into practice in some straightforward way. Schön (1995) has argued that we need a different way of knowing, an epistemology of practice, and this reminds us that we have little experience to guide the evaluation of our teaching practices, not just in terms of their influence on those we teach but also in terms of understanding the origins of our practices and how they are evolving. Learning to listen to our students (Cook-Sather, 2002) is one of the most obvious lines of inquiry.

"You can't fix what you can't see"

During our extended critical friendship, Rodrigo has emphasized the importance of identifying one's underlying assumptions, the lines of thought (of which we are typically unaware) that are implicit in our actions in the teacher education classroom. Argyris and Schön (1974) wrote about espoused theory (what we say we do) and theory-in-use (what our actions imply); they also contrasted single-loop and double-loop learning. We close with a reminder that you can't fix what you can't see, and self-study of teacher education practices is a methodology for helping us see what is normally hidden from view in our practice. Self-study has considerable potential for improving both individual teacher education practices and the all-important coherence of teacher education programs. Seeing our own practices in new ways (reframing) is the necessary prelude to generating and exploring new practices (repracticing).

Examples from our own practices and from our critical friendship involving the sharing of our self-studies are intended to provide insight into possible directions arising from self-study. The account of efforts to introduce self-study of teacher education practices into another language and culture demonstrates both the complexities and the possibilities for doing so. Although self-study in each culture will be unique and evolve in different ways, teacher educators exploring the challenges of learning from experience need not be limited to working in English.

Acknowledgment

We thank our colleague Max Lizano for his valuable assistance in confirming the accuracy of translations between English and Spanish.

Introduction

"Professional development", "continuing professional development" (CPD) and "professional learning" are concepts often conflated in meaning despite many writers defining these terms differently. While the body of literature relating these concepts to teacher educators is still in its infancy, it is gathering momentum (European Commission's, 2013; White et al., 2015; Murray et al., 2017; Ping et al., 2018; Byman et al., 2020). Understanding the nuanced differences that exist, in policy, practice and academia, when deploying these terms is important when considering how best we can prepare a future generation of teacher educators. When, for example, professional development is narrowly and instrumentally conceived, as a formal, external activity done to recipients then opportunities for authentic teacher educators' professional learning is limited. If, however, a wider interpretation of professional development is used embracing both formal and informal activities that enable critical professional reflection, then professional development, as a term, has validity. This point is significant for two reasons. First, because of the variegated composition of the contemporary teacher education workforce (Menter, 2018) in schools, colleges and university and their variegated professional learning needs. Second, most teacher educators do not experience supportive induction programmes or any form of formal route to their profession (Mayer et al., 2011; Czerniawski, 2013; Ping et al., 2018).

This article begins by examining what we mean by professional development and professional learning, and how both terms vary in their significance for teacher educators. The article then looks at the transitional fears experienced by neophyte teacher educators and the significance this has for their professional learning needs. Finally the article explores some of the literature on professional learning in the workplace and how that literature can contribute to increasing our understanding about teacher educators' professional learning needs.

Professional development and professional learning – an unnecessary dichotomy

Professional development is often deployed as a portmanteau term for what Day and Sachs (2009) describe as a "hugely complex intellectual and emotional endeavor" (p. 4). Typically, activities cited include observations, on-the-job coaching and mentoring, team teaching, self-directed study, in-service courses, sabbaticals, membership of working groups and networks, collaborative learning (both formally and informally), professional reflection and research (Dymoke and Harrison, 2006; Bates et al., 2011; Ping et al., 2018). However, writing about teachers, Stoll and Earl (2011) draw a distinction between professional development and professional learning:

Both are intentional, ongoing, systematic processes. Over time, however, the term "professional development" has taken on connotations of delivery of some kind of information ... in order to influence their practice whereas "professional learning" implies an internal process in which individuals create professional knowledge through interaction with this information in a way that challenges previous assumptions and creates new meanings (p. 4).

Watson and Michael (2016), writing about Scottish teacher professionalism, argue that while in the past Continuing Professional Development (CPD) became a commodified quantifiable "thing" that constructs professionalism as adherence to a contract, more recently in Scottish policy documentation (e.g. Donaldson, 2010; NPG, 2012) there has been a linguistic shift from "CPD" to "professional learning":

In contrast to CPD in which the teacher is the professional engaged in development, the discursive shift to professional learning sees the teacher embark on an endless journey of *becoming*, taking on the responsibility for their own self development

(Watson and Michael, 2016: p. 272).

Despite the growing body of literature on teacher educators' professional learning (e.g., Czerniawski, 2018; McPhail et al., 2018; White et al., 2020), this body is still relatively under-researched, with much of the literature drawing on teachers' continuing professional development (CPD) in schools. Kennedy (2005), for example, has identified nine models of teachers' CPD in international literature, classified in relation to their capacity for supporting professional autonomy and transformative practice. These teacher-based models have been usefully applied to literature on teacher educators' professional learning and development (see Bates et al., 2011):

- **Training model:** a top-down, skills-based technocratic view of professional development delivered by "experts" to passive learners e.g., early models of mentor training in which school mentors attended sessions run by university-based teacher educators and often held at the university.
- **Award bearing model:** award-bearing programmes normally validated by Higher Education Institutions (HEIs) e.g., Master's level programmes;
- **Deficit model:** positions professional development needs arising from becoming a teacher educator and acted upon either by the individual or part of a managed process on the part of the employer institution;
- **Cascade model:** in which an individual attends a professional learning event and then re-presents the content and resources of the event to other colleagues;
- **Standards-based model:** The use of standards (sometimes described as "professional frameworks") for teacher educators (e.g., as used in the Netherlands and the USA). Debates exist as to what extent these standards might be imposed on or owned by teacher educators and the extent to which they are seen as rules or guidelines accordingly.
- **Coaching model:** emphasizing the ways in which novice teacher educators work alongside more established members of the professional community or "communities of practice" (Lave and Wenger, 1991);
- **Community of practice model:** acknowledging many aspects of the coaching model above this model emphasizes the importance of "legitimate peripheral participation" (Lave and Wenger, 1991). The importance of supportive relationships in engaging with the practices of the community is emphasized. By engaging in peripheral activities new entrants become socialized into the tasks, ways-of-being, terminology and organizing principals of the community;
- **Action research model:** with its focus on reflective practice this model places high value on research engagement as a process in professional learning. While not demeaning the value of externally produced research the emphasis is on teacher educators identifying and implementing their own research activity;
- **Transformative model:** aligning professional learning to educational change this model effectively enables an opportunity to combine some or all of the above models positioning CPD as an opportunity to support and promote whole scale change in the education system.

Hadar and Brody (2017) divide professional learning programmes and models like these into two paths. The first, self-guided learning, consists of teacher educators engaging in research (often self study) individually or in groups (see Vanassche and Kelchtermans', 2015 review of teacher educators' self-study literature). The second path consists of more formalized programmes, courses and events specifically designed for teacher educators. The authors sub-divide this second classification into programmes initiated by associations for teacher educators that serve the needs of teacher educators from different institutions; and specific institutions providing in-service programmes of learning for its own employees (see below). This bifurcation is helpful when considering a further distinction made by Lipowski et al. (2011) between two forms of professional learning. First: *in-service programmes* are organized formal programmes for practitioners within the institutions where they work, considered by some to be the primary way in which they receive continuing support (Loucks-Horsley et al., 1997). Second: *continuous experiential learning* accommodates the more informal learning opportunities that contribute to everyday professional practice, the importance of which cannot and should not be underestimated when trying to understand the work teacher educators do in different national locations and the professional support they need (MacPhail et al., 2014).

The transitional fears of a heterogeneous profession

Making generalizations about teacher educators' professional learning needs is problematic. This is despite existing trends, internationally, in the implementation of professional standards' frameworks, and, in some cases the increasing take-up of school-based and school-driven teacher education (White et al., 2015). Professional learning needs vary depending on the context in which the teacher educator is situated. Universities, schools and colleges differ in their teacher education programmes; and university, college and school departments may vary in their interpretations of the knowledge, skills, practices, ethics, values and attributes that different frameworks prioritize. Murray (2014) also draws attention to how occupational change for neophyte teacher educators, usually those coming from a background in school teaching to higher education (HE) can bring with it professional uncertainty. Relatively poorly conceived university induction programmes for new staff often compound this transition, particularly for those

coming from the more practitioner-based occupations such as teaching, nursing and social work. Four transitional fears have been identified in the literature by Braund (2015) as teacher educators move into university employment.

1. Uncertainty with new professional roles (Boyd and Harris, 2010);
2. The nature of adult pedagogy (Loughran, 2006; Murray and Male, 2005);
3. Fears in relation to the adequacy of professional and academic knowledge bases (McKeon and Harrison, 2010)
4. The relative absence of collaborative working environments to facilitate reflective workplace learning (Eraut, 2004; Harrison and McKeon, 2008).

Such occupational changes can be particularly challenging for those coming from often senior positions within schools. Once in university employment, many teacher educators find themselves in relatively lower hierarchical positions in a university department and working within a discipline (education) often considered to be low status, "soft", applied and marginalized (Becher and Trowler, 2002; Murray, 2014).

Variability in the work of teacher educators

The variability in teacher educators' work roles is well documented (Lunenburg et al., 2014; Swennen et al., 2010) with each role associated with potentially a different set of professional learning needs. These work roles can include: teaching, coaching, the facilitation of collaboration between diverse organizations and stakeholders, assessment, gatekeeping (into the teaching profession), curriculum development, research, critical inquiry and writing. The nature of these roles and the professional learning associated with them will vary depending on a number of factors including the nature of employment (e.g., part time/full time; length of contract; length of time in service), the phase (e.g., primary/secondary/post-16) and whether teacher educators are situated in schools, colleges or universities. However it is the scholar and researcher roles that have been cited as the most pressing concern for novice teacher educators working in universities (Boyd et al., 2011; Braund, 2015).

Griffiths et al. (2014) make a further distinction found between two groups of university-based teacher educators. Those coming from Anglophone countries often move to universities having previously taught in schools. A second group exists from countries where teacher educators are drawn mainly from academic disciplines often lacking practical teaching experience (Griffiths et al., 2014). Both groups are likely to encounter different transitional experiences and tensions in the development of their own professional identities and their subsequent learning needs.

Understanding professional learning in the workplace

In the introduction to their book on workplace learning in teacher education, McNamara et al. (2014), draw attention to the historical trajectory England has taken in terms of workplace learning. This is a trajectory that has shifted from the 19th century classroom-based apprenticeship model of teacher education to the more theory-laden university-based model broadly adopted by the second-half of the 20th century. However since the 1990s the authors point to the turning of the tide in England (in contrast to much of the rest of Europe) with a return to a more extensive workplace-based model of teacher education, fueled by "radical ideological fervor" (ibid:1). But the authors also point out that this relocation of professional learning to the classroom is one that is qualitatively different and more complex than its 19th century ancestor, and that as such, it makes England an interesting "test-bed" for understanding the complexities in workplace learning.

The body of literature associated with workplace and practice-based professional learning frameworks continues to grow, but its capacity for theorizing such learning is still relatively under-deployed within the literature on teacher educators. As we saw earlier, Lave and Wenger's (1991) concepts of communities of practice and situated learning have dominated much of this literature. Both authors argue that this type of learning involves participation in a community of practice with learning moving from legitimate peripheral participation to central participation within that community. For example, I might start my new job at a university knowing what to teach, but it might take me several weeks to know: who to talk to, who to avoid, where to sit, what informal and formal "rules", norms and values I should adhere to if I am to be accepted as a colleague within that professional community. Communities of practice are made up of individuals who mutually engage in an activity and develop communal resources over a period of time. Learning in this sense is about participating in the practices associated with that community rather than an acquisition of knowledge per se. Learning is "situated" within the practices and social cultural context of that community (e.g., a university department, school, publishing company etc). A community is viewed as "the social configuration in which our enterprises are defined as worth pursuing and our participation is recognizable as competence" (Wenger, 1998: 5). Legitimate peripheral participation describes how novice employees start by engaging with subordinate and auxiliary practices within the periphery of that community (e.g., understanding the protocols of school visits; who to go to for important information within the department etc). As novices gain more experience they move toward the central participation within that community (e.g., being able to design and facilitate a curriculum for student teachers). Understanding the significance of different communities of practice within any organization is significant not just in providing greater insight into how individuals develop professionally but how communities of practice can contribute to the development of larger organizations (e.g., universities) of which they are a part (Philpot, 2014).

Knowledge for, in and of practice

In discussing teachers' professional practice-based learning, Cochran-Smith and Lytle (1999) distinguish between knowledge-for-practice, knowledge-in-practice and knowledge-of-practice. The authors conceive knowledge *for* practice as the formal substantive content knowledge required for teachers to improve their own practice and the learning of their students. The assumption here being that this "formal" knowledge generated by university-based researchers leads to more effective teaching and learning. Knowledge *in* practice, focuses on the day-to-day practical knowledge of the teacher "embedded in practice and in teachers' reflections on practice" (Cochran-Smith and Lytle, 1999: 250). This knowledge can be enhanced by reflecting on the work of expert colleagues and the challenging situations encountered in everyday at work. By focusing on knowledge in practice educators are encouraged to be aware and challenge their own assumptions, reasoning and decision making. Knowledge *of* practice assumes that knowledge to teach well is generated when teachers treat their own classrooms and schools "as sites for intentional investigation" while treating the knowledge produced by others as "generative material for interrogation and interpretation" (Cochran-Smith and Lytle, 1999:250). Practice-based education (PBE) locates learning in all three of these domains, acknowledging their interrelationship and significance in the process of professional reflection. In this reconceptualization of the reflective practitioner (Schon, 1983), PBE embraces a "form of social practice which shapes the educational development of individuals, framed around a perspective, model or theory of education that encompasses interactive philosophical, political, moral, technical and practical dimensions" (Higgs, 2011: 9). For the teacher educator, this emphasis on the complexity, value and significance of this type of reflection adds further weight to the distinction made earlier between teacher "training" and teacher "education". It also adds weight to the argument that there is "an urgent need to re-affirm teachers' and teacher educators' professionalism in terms of a research-based profession" (Jones et al., 2011: 272).

School-based teacher educators' professional learning

In recent years increasing attention is being paid to the shift, internationally, toward more school-based teacher education models (Boyd and Tibke, 2012; Lunenberg et al., 2014; White et al., 2015). In England, these models have included school-centered initial teacher training schemes (SCITTs), employment-based routes (EBITTs), School Direct, Teach First and the emergence of Teaching Schools. Such models mean that many teacher educators working in schools find themselves increasingly responsible for organizing all aspects of Initial Teacher Training (ITT) including the recruitment of trainees; the design, implementation and evaluation of course components and their assessment (McNamara et al., 2017; Czerniawski et al., 2017a,b). White et al. (2015: 443) divide school-based teacher educator roles into three areas, namely, those associated with a traditional mentoring role, those associated with a supervisory role across a school or schools and those associated more commonly with institute-based teacher educators (IBTEs). Teacher educators working in schools are also increasingly responsible for the continuing professional development of qualified school teaching staff within their own institutions.

Evidence of professional learning opportunities for school-based teacher educators (specifically related to their role as teacher educators) is, as yet, limited. A point emphasized by O'Dwyer and Atli (2015: 6) is that:

The lack of focus of in-service educators may represent an important omission given the current importance attached to teachers as life-long learners as a result of endemic professional change

The presumption that, if you can teach young people in schools you can therefore teach adults how to teach and how to teach more effectively, is one that has permeated teacher education systems in England since the introduction of the state system toward the end of the nineteenth century. This is perhaps one explanatory factor for why very few formal professional learning opportunities have existed for school-based teacher educators in the past. And yet the knowledge, skills, creativity and emotional endeavor required to teach adults varies considerably in content, form, process and technique to that required when teaching children. The dual identity that school-based teacher educators possess (as both teachers and teacher educators) adds additional complexity in understanding what sorts of professional learning activities are of most value to the profession as a whole.

However while the literature on school-based teacher educator professional learning might be limited it is nevertheless growing. A study of university and school-based teacher educators in the Netherlands (Dengerlink et al., 2015) has indicated that the preferences of school-based teacher educators vary over time. Teacher educators with less experience were interested in coaching skills, pedagogical content knowledge, their own role within wider communities of teacher educators and opportunities to contribute to the knowledge development of the profession as a whole. They valued participation in seminars, conferences and formal courses and desired greater opportunities for more structured learning arrangements (e.g., supervision, peer-coaching etc). However school-based teacher educators with more than 7 years experience were interested in learning about the policy context of school-university partnerships, curriculum issues at the programme level and the pedagogy of teacher education. These more experienced educators tended to place greater value on professional reading, participating in research projects and the role that experimentation can play within their own professional practice. Common to both groups was the value placed on conversations with colleagues as a significant form of professional learning.

In England, one of the outcomes of governmental policy in initial teacher education since 2010, has been the expanding provision of *professional development* for some teacher educators in some schools albeit in fragmented and particularized forms. A point emphasized by Murray et al. (2017):

The emergence of "Teaching Schools" as recognized centres of excellence, with government funding available to support school-led ITE programmes and school-focused research and development projects, has greatly increased the professional learning opportunities available to school-based educators (p. 660).

However, in England, opportunities brought about by an expanding school-based system of teacher education might not necessarily result in more effective *professional learning* of its school-based teacher educators. Earley and Bubbs (2004) distinguish "hard" economic utilitarianism, where professional *development* addresses the strategic goals of an institution, from a "softer" developmental humanism in which professional *learning* caters for valued, confident and motivated staff. There is a danger therefore that in England's marketized and competitive school system, teacher educators working in schools might be subjected to the former rather than the latter.

Conclusion

When professional development is narrowly and instrumentally conceived as a formal, external activity "done to" recipients then opportunities for authentic teacher educators' professional learning is limited. If, however, a wider interpretation of professional development is used embracing both formal and informal activities that enable critical professional reflection then professional development, as a term, has validity. However I prefer the term "professional learning" to "professional development" and define teacher educators' professional learning as both the formal and informal processes that enable them to improve their professional practice throughout their careers with a commitment to transform education for the better. By understanding, more fully, the sorts of transitional dilemmas encountered by those entering teacher education for the first time, institutional leadership teams in schools, colleges and universities are in a position to construct more meaningful professional induction and more sustained, valued, authentic and nuanced professional learning opportunities. However the article affirms existing literature that professional learning for teacher educators is often deemed for more valuable, not through formal provision and organized programmes, but through informal workplace learning (Boyd et al., 2011; Murray et al., 2017). While professional learning opportunities for teacher educators working in schools and universities are on the rise much more needs to be done to foster and recognize the professional learning needs of both groups of educators. One notable difference between these groups centers around the degree of support sought for research activities with this having greater priority for higher education-based teacher educators.

Introduction

Since the early 2000s, teacher education scholars have argued the need to focus more concerted on teacher educator development. Despite more than 20 years of such calls, however, teacher educator preparation and support remain under-practiced, under-supported and undertheorized. Formal preparation pathways for those interested in becoming teacher educators are few and far between (Cochran-Smith et al., 2020), and teacher educators report mostly “falling into” the profession and figuring out what teacher educating entails while “already on the job” (Loughran, 2006; Goodwin et al., 2014).

Supporting teacher educators’ development matters for multiple reasons. Numerous accounts, for example, illustrate that making the transition from teacher to teacher educator is not automatic or natural, (Feiman-Nemser and Buchmann, 1985) since teacher educating requires pedagogical approaches that are distinct from classroom teaching (Berry, 2009; Korthagen, 2020; Murray and Male, 2005). Others underscore how teacher education’s complexity and contingency in relation to local contexts—including the communities for whom teachers are prepared, teacher educators’ and teachers/learners’ identities, evolving policy and political landscapes and institutional conditions—demand specially-prepared, highly skilled practitioners (Stillman and Beltramo, 2019). Still others point to claims about the ineffectiveness of teacher education as a whole as a reason for attending more seriously to teacher educators’ development. Paradoxically, claims of teacher education’s ineffectiveness often decry its wrongheadedness (Cochran-Smith et al., 2008; Levine, 2006), as well as its weak socializing impact on graduates (Zeichner and Tabachnick, 1981). Stronger teacher educator preparation could, therefore, be important for stronger teacher education overall.

Less common among these critiques are those that outline how limited attention to teacher educator preparation contributes to teacher education’s struggle to prepare equity-and justice- oriented teachers (e.g., Cochran-Smith, 2003; Conklin, 2020; Stillman and Beltramo, 2019; Stillman et al., 2019a; Beltramo et al., 2020). Yet, ample evidence suggests that teacher education often perpetuates racism and white supremacy, contributing to rather than disrupting the harm that K-12 schools have historically imposed on students from non-dominant communities (Milner, 2008; Sleeter, 2017).

This paper argues that teacher educators stand to play a crucial role in transforming teacher education from a status quo-perpetuating endeavor into an equity- and justice-oriented one and suggests that specialized teacher educator preparation is essential to realizing this possibility (Souto-Manning and Stillman, 2020; Stillman et al., 2019a,b). Following an account of how teacher education upholds racism and centers whiteness through its everyday, largely taken-for-granted practices, the chapter proposes a doctoral curriculum framework for preparing teacher educators for the transformational work the field requires.

Racism and the “overwhelming presence of whiteness” in teacher education

Although it has become fashionable for university teacher education programs to claim the mantle of social justice, teacher education often fails to disrupt and arguably contributes to injustice and growing opportunity gaps for students of color and other minoritized students (e.g., Milner, 2008; Picower, 2021; Souto-Manning, 2019). This chasm between teacher education’s aims and actions

reflects the “gross undertheorization” of race and racism in teacher education (Milner et al., 2013), as well as the field’s persistent and “overwhelming presence of whiteness” (Sleeter, 2001, 2017).

The overwhelming presence of whiteness in teacher education

At the most basic level, whiteness in teacher education is evidenced by its participants. In the US, around 74% of teacher candidates in university programs are white (U.S. Department of Education, 2016); this number stands in stark contrast to the US K-12 public school student population, of which more than 50% are students of color (National Center for Education Statistics, 2019). White teacher candidates also complete university preparation programs at a higher rate than teacher candidates of color, with more than 80% of graduates from US universities identifying as white (U.S. Department of Education, 2016). Although more recent statistics have been difficult to locate, as of around 15 years ago, the numbers looked similar for university-based teacher educators, who were then around 88% white (Ladson-Billings, 2005).

Complicating the notion of whiteness, Ohito (2020) explains that “whiteness can be considered ‘a constellation of knowledge, ideologies, norms, values, identities, and behaviors that maintains a race and class hierarchy’ (Helfand, 2009, p. 77). This definition gestures toward the entwinement of Whiteness and racism.” This “constellation” is performed in teacher education’s everyday acts through embodied enactments of Whiteness (Ohito, 2020). For example, Whiteness permeates teacher education’s curriculum and learning experiences since a mostly white teacher education faculty means programs largely reflect “white sensibilities” (Sleeter, 2017). Programs commonly treat teaching and teacher education as culture-free (Nieto and Bode, 2011) and/or subscribe to an “add-on” approach in which learning about equity and diversity are relegated to one or two courses rather than addressed program-matically (Cochran-Smith, 2000; King and Butler, 2015; Rueda and Stillman, 2012).

Even when teacher education programs address equity and diversity, whiteness still tends to take center stage. Teacher education instruction is often geared toward white teacher candidates, assumed to have little knowledge of or experience with non-dominant communities (Lowenstein, 2009). In addition, during discussions about equity and justice, white teacher educators, especially, have been shown to: enable white teacher candidates to control the narrative; privilege white candidates’ emotional needs; passively accept deficit framings of students and communities of color; and selectively address or evade racism—based on their own comfort (Chang-Bacon, 2022; Matias, 2016; Ohito, 2020; Sleeter, 2017; Teachers of Color Collective and Souto-Manning, 2022). These actions can hold true even for white teacher educators who consider themselves anti-racists (Ohito, 2020).

Meanwhile, just as teacher education is often treated as culture-free, the K-12 content that teacher education programs expect teacher candidates to learn typically mirrors the Eurocentric, white dominated K-12 curriculum (Picower, 2021). Literal and figurative distance and disconnection between university teacher education and the knowledges and experiences of communities of color likewise perpetuates whiteness’s grip (Souto-Manning and Martell, 2019). Given all this, it is no surprise that white teachers who matriculate from preservice programs typically “are not equipped to offer the racially/ethnically diverse students in schools a strong and culturally responsive education” (Sleeter, 2017, p. 157).

It is to state the obvious to acknowledge that the conditions and practices of “normalized White culture” (Brown, 2014, p. 340) in teacher education don’t just fail to adequately prepare white teacher candidates to teach students from non-dominant communities; they also negatively impact teacher candidates of color (Brown, 2014; Teachers of Color Collective and Souto-Manning, 2022). In addition to harms resulting from the patterns described above, teachers and teacher candidates of color consistently report experiencing marginalization, silencing, and a lack of belonging in teacher education (Brown, 2014; Haddix, 2012; Souto-Manning and Emdin, 2020; Teachers of Color Collective and Souto-Manning, 2022). Not only does teacher education regularly devalue the histories, knowledges, and experiences of candidates of color, it also often essentializes their identities (Matias, 2016; Teachers of Color Collective and Souto-Manning, 2022). This includes assumptions that teacher candidates of color enter teacher education already committed to teaching for social justice and ready to teach and serve as role models for minoritized children (Brown, 2014). Brown (2014) explains this “entraps these teachers to one specific role” while masking “the actual ways that they might make a pedagogic difference for both K-12 students of color, as well for their White counterparts” (Brown, 2014, p. 338). Assuming teacher candidates of color enter programs “ready” also absolves teacher educators from their core responsibility to help all candidates develop crucial dimensions of knowledge and expertise needed for effective teaching. Together, these patterns suggest that calls and efforts to “diversify” teaching and teacher education may ultimately serve white interests by making teacher education appear more inclusive, without transforming endemic structures and conditions that perpetuate racism and white supremacy (Brown, 2014; Sleeter, 2017).

How teacher education preserves the status quo of whiteness

Multiple factors sustain racism and the “overwhelming presence of whiteness” in teacher education. In addition to the field’s under-theorization of race, racism, and whiteness (Milner et al., 2013), which normalizes and obscures racism’s presence and role, teacher education’s conservatism—its endurance over time with little change—serves to maintain status quo-perpetuating pedagogies and practices (Ellis and McNicholl, 2016; Goodwin et al., 2014). The larger institutional culture and neoliberal policy contexts surrounding university teacher education likewise uphold the status quo (Picower and Kohli, 2017; Zeichner, 2010). Commonly considered universities’ “cash cows,” programs often foreclose access for students who must work while preparing to teach by scheduling courses during traditional hours and requiring extensive, unpaid field experiences. Biased subject area exams and teacher performance assessments shown to discriminate against teachers of color ensure the predominance of white teacher candidates

and advance the false narrative that they are more qualified to teach than candidates of color (Ladson Billings, 1998; Sleeter, 2017). Meanwhile, high-stakes accountability policies (e.g., standardized testing in K-12 schools; state and national accreditation regimes; etc.) ensure the teacher education curriculum remains white- and Euro-centric, and English dominant (Perez Huber et al., 2006; Souto-Manning, 2021).

At the same time, faculty reward structures—which treat teacher education as low-status and privilege research productivity over teaching and other applied work—de-incentivize teacher educators from engaging in necessary (un)learning about racism and other forms of oppression (Cochran-Smith, 2003) or time-intensive justice-oriented work like building authentic relationships with and learning from school partners and community members. Relatedly, teacher educators who express anti-racist stances are more likely to receive poor course evaluations, with particularly harmful outcomes for teacher educators of color (Jayakumar et al., 2009; Matias, 2016; Ohito and Deckman, 2018). Notably, these conditions intersect with persistent, and well-documented dilemmas of teacher education, like the apprenticeship of observation (Lortie, 1975), whereby teacher candidates, having attended status-quo perpetuating K-12 schools themselves, resist approaches to schooling with which they are unfamiliar.

As all of this suggests, it will take nothing short of transformation for teacher education to become genuinely anti-oppressive and capable of preparing equity- and justice-oriented teachers. This transformation will require pushing beyond incremental changes that involve tinkering with the field's lowest-hanging fruits (e.g., adding a few new readings; revising a single course, etc.), instead addressing the field's diseased root structures that propagate some of teacher education's most troubling features.

Some scholars have argued that highly qualified, equity- and justice-oriented teacher educators may be the linchpins for inciting such foundational change (Carter Andrews, 2021; Cochran-Smith, 2003; Goodwin and Kosnick, 2013; Souto-Manning and Stillman, 2020; Stillman and Beltramo, 2019), especially given the transformational potential of their pedagogical work (Conklin, 2015, 2020; Ellis and McNicholl, 2016). Ellis's (2018) definition of transformation as "change processes that take place *within* social systems or formal organizations and that require ... the work-on-change to be driven by the momentum of participants' agency rather than ... by external political energy," likewise suggests teacher educators are among those best positioned to stimulate consequential changes in the field.

Yet, current pathways into the profession, including learning while "on the job," offer limited opportunities for emerging teacher educators to develop the "shift in underlying values and rationalities as well as concrete labor practices" (Ellis, 2018) needed to refashion teacher education's architecture. This paper, therefore, offers ideas for a doctoral curriculum that aims to equip teacher educators for transformative possibilities.

Conceptualizing teacher educator development as a learning problem

Questions about teacher educator development and the design of teacher educator preparation are fundamentally questions about learning—what it aims to achieve and how it is organized (Korthagen, 2020). Thus, before outlining the proposed design, I turn to a brief discussion of learning theory. With the goal of catalyzing transformation in teacher education through the preparation of equity- and justice-oriented teacher educators, I lean on two learning theories: cultural historical activity theory (CHAT) (Vygotsky, 1978) and critical pedagogy (Freire, 1970). Through their complementary emphases on culture and power's roles in learning, these theories offer special purchase for grappling with equity and justice issues and for exploring transformative possibilities for the field.

The value of CHAT in theorizing teacher educators' learning and activity

As a situated learning theory, CHAT treats the development of learners, in this case teacher educators, as a social process that unfolds within the context of collective activity (Engeström, 1999, 2001). In viewing learning as collective, social, and contextual, CHAT draws attention to factors that mediate teacher educator learning, including, for example: state and district policies shaping K-12 teaching and teacher education practices; the stated missions, student populations, and geographic locations of institutions where Novice Teacher Educators (NTEs) engage in doctoral work and teacher educating; and the various participants in teacher education's activity system, including peers, teacher candidates, faculty, K-12 learners, and the local schools and communities to whom teacher education is accountable. This framing encourages learning experiences that treat NTEs as dynamic learners and cultural beings, whose identities and lived experiences and understandings mediate their learning in consequential ways. It additionally underscores the potential power of learning experiences that provide NTEs with opportunities to collectively identify and explore questions and dilemmas that emerge from the institutional, political, and social contexts of their own teacher educating experiences.

CHAT also views transformation and learning as interconnected. CHAT suggests that when existing systems "appropriate" newly introduced influences, disruptions in need of resolution emerge, which, in turn, generate opportunities for (a) expansive learning among the system's participants and (b) the system's transformation (Engeström, 1987, 1999, 2001). This conceptualization of learning underscores the transformative potential of learning experiences designed to help NTEs surface dilemmas or conflicts from their work and then muddle together toward resolutions that can engender disturbances to the system—in this case, teacher education's "historically sedimented" conditions and practices (Souto-Manning and Martell, 2019). Indeed, CHAT inspires us to imagine how we might leverage disruptions as openings for "future oriented innovative solutions" to teacher education's most stubborn challenges including those related to preparing equity- and justice-oriented teachers (Jóhannsdóttir, 2010, p. 169).

Critical pedagogy as a complementary frame for considering teacher educators' learning

Critical Pedagogy likewise views learning as a collective, social process, but as an explicitly liberatory theory, it reminds us that education is power laden and tends to socialize students into the status quo (Freire, 1970). To overcome these tendencies, critical pedagogy implores educators to use education to “desocialize” (Shor, 1987) through a process whereby learners expand their consciousness of the socio-political context and their positions and roles therein through dialogic exchanges grounded in lived experience. Paired with reflective action—what Freire termed “praxis”—this critical cycle of learning can support participants to transform their worlds (Freire, 1970; Souto-Manning, 2010).

Like CHAT, critical pedagogy points to the potential benefits of learning experiences for NTEs that are grounded in their own subjectivities and lived realities and that offer opportunities for collective problem solving in the service of transformation, such as, imagining and working toward a more just future for teacher education. Given its aim to name and challenge oppression, critical pedagogy also encourages learning experiences that invite explorations of how teacher educators—novices and veterans alike—are implicated in teacher education’s perpetuation of oppression and inequality.

Notably, CHAT and critical pedagogy’s notions of learning dovetail with scholarship that suggests that to disrupt the status quo, teacher education must resist treating knowledge as fixed or unproblematic, as well as assumptions that learning to become a responsive teacher can occur through “training” in the technical methods of teaching (Bartolomé and Trueba, 2000; Ben-Peretz, 1995; Korthagen, 2020). Goodwin et al.’s (2014) application of Cochran-Smith and Lytle’s (1999) knowledge domains for teaching similarly underscores the risks associated with privileging knowledge *about* teaching (“knowledge-for-practice”) in learning experiences for teacher educators, while pointing to the transformative power of learning experiences that support teacher educators to bring into conversation knowledge-for-practice and understandings acquired through their own teacher education practice (“knowledge-in-practice”) to generate “knowledge-of practice.”

In the subsequent section, I draw on this theoretical framework to offer design recommendations for preparing equity- and justice-oriented teacher educators. While the proposal aims to advance thinking and practice across institutions, CHAT and critical pedagogy’s notions of transformation discourage “a completed recipe for ‘rolling out’ or ‘scaling up’” teacher educator development, “as the pervasive metaphors of reform might have it” (Ellis and McNicholl, 2016, p. x). Contrary to more technical conceptions of change, the designs advanced in this chapter are meant to be taken up rather than scaled up; this includes reflecting and responding to NTEs’ identities and subjectivities and to the communities and contexts where learning is situated.

A doctoral curriculum for preparing equity- and justice-oriented teacher educators

This design proposal builds on the thoughtful work of scholars who have advocated for deliberate pathways into teacher education (e.g., Cochran-Smith, 2003; Goodwin and Kosnick, 2013; Hollins et al., 2014; Korthagen, 2020; Loughran, 2006; Stillman and Anderson, 2014; Stillman and Beltramo, 2019; etc.). Unlike accounts which explore a single dimension of teacher educator preparation (e.g., a pedagogy of teacher education course), however, this proposal offers recommendations for a reconfiguration of the positioning of doctoral students within programs of teacher education and a doctoral-level curriculum that can be re-contextualized across settings. Heeding calls to center “the why” of teacher educator preparation in program design (Conklin, 2015) and research that points to concerning limited understandings about “multiculturalism” and “diversity” among practicing teacher educators (Goodwin et al., 2014), this proposal aims to offer insights for preparing equity- and justice-oriented teacher educators who can provoke radical change in the field.

It is important to note that the proposed curriculum represents a deliberate departure from traditional doctoral education which privileges research training and treats graduate student appointments in teacher education as merely labor. These more traditional programs frame teacher educating as intuitive, low-skilled work that any doctoral student could do temporarily and assume that disciplinary expertise or experience in K-12 schools are acceptable proxies for preparedness to teach teachers. These assumptions have been shown to contribute negatively to teacher educator efficacy and teacher education quality.

Instead, this design assumes that to advance the field, teacher educators must become skilled not only as teacher education researchers but also as practitioners of teacher educating who can meaningfully link scholarship and practice (Cochran-Smith and Zeichner, 2005; Goodwin and Kosnick, 2013). These abilities are especially critical to efforts to transform the field, given the need for specialized knowledge about teaching and teacher educating for equity and justice, and the need for more and better research, grounded in problems of practice, about equity- and justice-oriented teacher education (Beltramo et al., 2020; Cochran-Smith, 2003; Goodwin et al., 2014; Stillman and Beltramo, 2019).

Whereas articulating the why and how of teacher educator preparation is relatively straightforward, questions about what teacher educator preparation ought to involve are harder to resolve. As many have argued, the field’s limited agreement about what teacher educators need to know and be able to do hampers efforts to codify a knowledge base for teacher educators (Goodwin and Kosnick, 2013; Goodwin et al., 2014; Korthagen, 2020). Others, meanwhile, have raised questions about the very premise of identifying a unitary knowledge base for teacher educators, given the mediating roles of identity and context in teacher educating and teacher educator learning, and the risks to equity and justice that a predetermined knowledge base may impose (Stillman and Beltramo, 2019; Stillman et al., 2019a,b).

What does equity- and justice-oriented teaching educating involve?

Any attempt at curriculum/program design demands some delineation of the work that equity- and justice-oriented teacher educators are responsible for. Several scholars have suggested competencies that all teacher educators need (Goodwin and Kosnick, 2013; Koster et al., 2005) with more recent empirical work identifying teacher educators' central tasks (Goodwin et al., 2014). Goodwin and Kosnick (2013), for example, organize teacher educator competencies into five knowledge categories: personal, contextual, pedagogical, sociological, and social. These categories complement Koster et al.'s (2005) competency and task domains, which similarly underscore teacher educators viewing themselves as learners (personal knowledge) and having the ability to design and deliver responsive programs (pedagogical, contextual, and sociological knowledge), where they must draw on communicative and reflective competencies (social knowledge), while participating in policy development and navigation (contextual knowledge). The description of teacher educator responsibilities I offer embraces and expands on these framings, focusing specifically on expectations for equity- and justice-oriented teacher educators.

Building on accounts of how racism and whiteness manifest in teacher education, I argue that equity- and justice-oriented teacher educators' central responsibility is to disrupt racism and the "overwhelming presence of whiteness" in the field through the preparation of anti-racist teachers. Here I borrow from Ohito's (2020) definition of antiracism through which she explains, "Antiracism is the practice of resisting or opposing racism and/or intervening in ways that subvert its impact and relax its hegemonic clasp on persons, institutions, schools, and other such entities in society. Antiracist teaching engenders the pedagogical application of an antiracist stance" (p. 19).

Preparing anti-racist teachers unfolds for teacher educators at the level of courses, programs, and institutions, and in relation to local and national policy. At the very heart of this work is developing teacher education programs that prepare teachers to "challenge the field's 'pathology of deficiency' (Ladson-Billings, 2017), and instead honor, build upon, and sustain the knowledges, beliefs, and voices of intersectionally minoritized students" (Stillman and Beltramo, 2019, p. 26). An extensive body of literature animates this charge, with emphasis on teachers recognizing, centering, and leveraging minoritized students' knowledges, cultural practices, experiences, and interests as resources for learning, rather than suppressing or exchanging them for knowledge deemed higher-status or academic (Alim and Paris, 2017; Ladson-Billings, 1995; Moll et al., 1992). Much of this work centers the dynamic role of culture in learning and calls on teachers to honor students' humanity by "produc[ing] students who can achieve academically" (Ladson-Billings, 1995, p. 474), while maintaining their "cultural integrity" (p. 476).

Many agree that equity- and justice teacher educators must also support teacher candidates to develop critical consciousness—an ability to engage in a structural analysis of inequality (Freire, 1970; Shor, 1987; Souto-Manning, 2010)—as well as the "ideological and political clarity" (Bartólome and Trueba, 2000) needed to operate as agents of change. Recent scholarship, especially, illustrates the importance of teachers engaging in advocacy in solidarity with minoritized students, families, and communities (Guillén and Zeichner, 2018; Love, 2019; Souto-Manning and Martell, 2019). These understandings and sense of agency come together when equity- and justice-oriented teachers exercise what Horn and Campbell (2015) termed "pedagogical judgment," whereby teachers learn to draw on their "situated knowledge of their particular teaching context" to "work nimbly" to respond to the "perennial puzzles of teaching" (p. 155).

In addition to developing curriculum, equity- and justice-oriented teacher educators must have the understandings and skills needed for de-centering whiteness and challenging deficit framings, while centering the knowledges of teacher candidates of color in course discussions and in feedback on candidate assignments (Brown, 2014; Sleeter, 2017; Stillman and Beltramo, 2019; Stillman et al., 2019a,b). This key dimension of teacher educator mediation, at the center of which is teacher educators' communication competencies (Ohito, 2020), often goes unrecognized in discussions of teacher educators' work (Anderson and Stillman, 2013a; Stillman and Anderson, 2016; Stillman and Beltramo, 2019).

Equity- and justice-oriented teacher educating additionally involves developing awareness of and confidence to challenge racism and whiteness across teacher education spaces, beyond courses (Stillman et al., 2019b). This includes drawing on equity- and justice-oriented understandings to inform program development and work surrounding candidate field experiences (Anderson and Stillman, 2013b; Guillén and Zeichner, 2018). Critically navigating (and resisting) institutional, policy and political conditions—increasingly crafted in the service of neo-liberal, technocratic goals that take a race-neutral view of education—presents yet another layer of teacher educator responsibility (Zeichner, 2010).

Scholarship is also clear about the importance of teacher educators—especially those committed to disrupting the status quo—wearing the complementary hats of teacher educator practitioner and researcher (Cochran-Smith, 2003; Zeichner, 2005). Not only does studying teacher education, including one's own practice, serve as vehicle for improving one's own pedagogy (Korthagen, 2020), it additionally contributes to teacher educators' identities as change agents, capable of getting and doing "better" (Lytle, 2008).

These bodies of research provide direction for designing preparation experiences that equip NTEs for transformative, anti-racist practice. In the subsequent sections, I expand on these accounts and their intersections to propose a design that aims to advance the field's thinking about doctoral education programs designed to prepare and support equity- and justice-oriented teacher educators. Throughout, my recommendations reflect my position that a neutral approach to teacher educator development—while still a better option than no formal preparation—falls short of addressing the field's most urgent needs, and that transforming the field requires learning experiences organized for that purpose.

Three dimensions of doctoral education for equity- and justice-oriented NTEs

The curriculum design includes three overarching components: (1) Teacher Educating for Equity and Justice, (2) Equity- and Justice-oriented Doctoral Coursework, and (3) Critical Inquiry Communities. Fig. 1 provides a visual representation of this design.

The triangular representation, with double-sided arrows connecting the different points, illustrates components' potential interactions with one another. One such interaction, for example, might involve NTEs learning to conduct research on teacher education through coursework, and then engaging in such research—grounded in questions and dilemmas identified from one's own teacher educating—within a critical inquiry community.

The concentric circles surrounding the triangle, meanwhile, illustrate the mediating roles of the institutional and policy contexts within which teacher educator development occurs. This visual intends to communicate that learning and teacher educating unfold contextually, that practicing across different settings requires re-contextualizing rather than replicating practice, and that learning to engage critically with institutional and political forces is central to teacher educators' work and learning. I unpack each of the three major components below.

Teacher educating for equity and justice

Teacher education programs commonly hire doctoral students as adjunct instructors and fieldwork supervisors, often depending on them to keep programs afloat. Qualifications for these positions typically include disciplinary expertise and recent or current experience as a practicing teacher. Although such knowledge and expertise may be preconditions for teacher educating, they are not proxies for teaching about teaching (Feiman-Nemser and Buchmann, 1985). Nevertheless, these students tend to be hired "as is," perhaps with opportunities to engage in generic onboarding experiences (e.g., focused on learning management systems, syllabi requirements, teaching college students, etc.), but rarely with access to ongoing support or learning focused on teacher education's complexity. This practice poses significant risks to teacher education quality, in general, but is especially problematic in relation to equity- and justice-oriented teacher educating which requires teacher educators' specialized knowledge and critical treatment—rather than ready acceptance—of traditional teacher education structures and practices.

This first component of the proposed design—Teacher Educating for Equity and Justice—recognizes that even the most novice teacher educators occupy vital positions as equity- and justice-oriented educators of teachers and therefore aims to reconfigure the positioning of doctoral students within teacher education programs. Instead of hiring doctoral students as a means of responding to labor demands or as a funding fallback for students with little interest in teacher education, this design both requires and guarantees NTEs' access to multiple, varied, extended, and supported opportunities to practice equity- and justice-oriented teacher educating. (This points to benefits of doctoral programs' proximity to equity- and justice-oriented teacher preparation programs.)

Contrary to sink-or-swim induction models common in teacher education, support would accompany NTEs through these experiences via individual mentoring by faculty or more advanced doctoral students, and mediation that the other two curriculum components—coursework and critical inquiry communities—provide. For example, specialized courses (described below) would provide opportunities for NTEs to draw connections between their experiences as teacher educators and course themes and questions. Participation in a critical inquiry community would offer a critical, collegial, environment for facilitating NTEs' inquiry into

Fig. 1 A three-pronged design for specialized doctoral education

their own practice in context (also described below). These learning experiences might also be leveraged as opportunities to support (novice) school-based teacher educators (i.e., mentor teachers in K-12 settings), who are similarly almost always expected to learn to teacher educate on their own. Bringing school- and university-based teacher educators together could in turn improve equity- and justice- oriented teacher educating across contexts and strengthen university-school partnerships, with NTEs playing a genuine role in this crucial, relational work.

Relatedly, reconfiguring doctoral students' positions in teacher education can also expand the types of learning experiences equity- and justice-oriented NTEs have access to. In addition to teaching individual courses, doctoral students might, for example, be supported and compensated to contribute to curriculum development efforts aimed at deeper, equity- and justice- oriented program-level change. Meanwhile, opportunities to engage in equity- and justice-oriented practices beyond course instruction—for example, collaborating with and learning from local families and communities to rethink/reorganize programs (Zeichner et al., 2016)—would equip NTEs with experiences needed for transforming teaching education in their future positions, while also helping programs where they are working during doctoral study move toward systemic change. Notably, all of these experiences could provide rich material for collaborative studies, potentially explored through course assignments and participation in critical inquiry communities.

Unlike programs where doctoral students pass through the revolving door of adjunct instructors, this design also aims to support NTEs over time. Not only would this allow for growth and setbacks, NTEs would also be able to participate as full members of the teacher education community during their time as doctoral students. This stands to provide NTEs with authentic and supported opportunities to grapple with teacher education's many layers of complexity and to position them as leaders capable of guiding equity- and justice-oriented change.

Equity- and justice- oriented doctoral coursework

Coursework resides at the center of doctoral education, often dominating the first two or more years of study. This dimension of the proposal considers possibilities for four specialized courses for facilitating NTEs' learning about preparing equity- and justice-oriented teachers and challenging racism in the profession, more broadly. These include:

- Critical perspectives on the history and context of teacher education
- Becoming a teacher education researcher
- Understanding and designing for teacher learning
- Pedagogies of equity- and justice-oriented teacher education

Because my goal is to stimulate dialog about, rather than present a recipe for, the preparation of equity- and justice-oriented teacher education, my descriptions are merely hypotheticals that I hope provide fodder for necessary discussions in the field. One assumption I make is that these courses would run as seminars, where authentic dialog and collective problem solving could occur.

Critical perspectives on the history and context of teacher education

Scholars have argued that teacher educators' abilities to challenge the status quo of schooling hinge on opportunities for deep (un) learning about structural inequality, and about how historic and current policies and institutional conditions shape the profession (Cochran-Smith, 2003; Cochran-Smith et al., 2020; Sleeter, 2017). This course would aim to fulfill that purpose. The course, for example, might explore how the profession emerged, and how shifting politics and policies have shaped the field over time. Rather than taking a neutral stance on these issues, the course would center how racism and other forms of oppression have been perpetuated in and through teacher education and offer examples, drawn from critical scholarship, of what anti-racist teacher education could look like, including the policy and institutional changes—and teacher educators' potential roles in shaping them—needed to support it.

The course might also ask NTEs to tap into their teacher educating experiences as generative contexts for bringing these topics to life. For instance, NTEs might trace the history of a current a teacher education policy or practice of concern (e.g., the use of standardized assessments for licensing purposes; pressure to privilege the "science of reading" over responsive literacy instruction; etc.) and explore how it undermines and/or contributes to equity and justice goals. A next step might involve working with peers to imagine how to critically navigate the policy or practice, perhaps experimenting with these imaginings in and through their own practice. Such an assignment stands to deepen NTEs' understanding of the profession's current architecture, while providing opportunities to appropriate the identity of policy co-author, challenging the idea that teacher educators must accept policies and practices as permanent fixtures (Stillman and Anderson, 2015).

Becoming a teacher education researcher

The field is clear about the benefits of teacher educators becoming knowledgeable about teacher education's research base as well as active researchers of teacher education themselves (Korthagen, 2020). Such benefits include preparedness to make informed rather than anecdotal decisions about teacher education practice (Zeichner, 2005) and greater inclinations to critically analyze existing systems, structures, and practices, rather than accepting them as unproblematic (Cochran-Smith, 2003). In this respect, research facility may be crucial to teacher educators' abilities to challenge the field's conservatism, including its perpetuation of racism. Yet, while most university teacher educators complete research-focused doctoral programs, few are well-versed in teacher education scholarship, and few report applying their research knowledge to the study of teacher education (Goodwin et al., 2014).

This course aims to address this problem, building on more general methodology courses to support NTEs to design and conduct justice-oriented teacher education research. A key element of the course would involve exploring self-study methodologies, given their significance in building an empirical foundation for the field (Berry, 2007; Korthagen, 2020; Zeichner, 1999) and the opportunities they provide for practicing teacher educators to embody a critical learning stance (Cochran-Smith and Lytle, 2009). As a methodology that illustrates “that at the core of expert practice is not the strict implementation of evidence-based practices, but the need to make subtle judgments in unique situations” (Korthagen, 2020, p. 333), self-study is especially well-suited for research that advances equity and justice.

To work toward these learning goals, an assignment for this course might require NTEs to conduct practitioner inquiry projects in relation to their own teacher educating, specifically exploring questions about racism and other forms of oppression, and with particular attention to how they are implicated in perpetuating and disrupting oppression in and through practice. Engaging in self-study within the confines of a semester-long course wouldn’t allow for extensive study. However, it would provide NTEs with a foundation for later self-studies and a built-in inquiry community where collective, critical sensemaking could be facilitated. These activities would equip NTEs to participate in Critical Inquiry Communities (described below).

Despite self-study’s powerful contribution to local and public knowledge (Cochran-Smith and Lytle, 2009), scholars have also underscored its limitations, including studies’ disconnections from one another, and lacking methodological variation (Cochran-Smith and Zeichner, 2005; Korthagen, 2020). Thus, this course would offer NTEs opportunities to engage with multiple methodologies—including critical approaches to quantitative research—for the purpose of studying and transforming teacher education. The course would also privilege critical theoretical methodological and theoretical frameworks (e.g., Critical Race Theory, feminist theories, queer theory, decolonial theories; etc.) to generate understandings about teacher education, currently, and actionable insights for radical change.

Understanding and designing for teacher learning

Ironically, studies of teacher education rarely make explicit a view of teacher learning (Anderson and Stillman, 2013a; Clarke and Hollingsworth, 2002). As Korthagen (2020) explains, this tendency weakens the study and practice of teacher education by compromising efforts to delineate a pedagogy of teacher education and obscuring the difference between student and teacher learning, a key distinction in teacher educating (Feiman-Nemser and Buchmann, 1985; Murray and Male, 2005). Failing to attend explicitly to teacher learning in teacher education research additionally leaves us with vague notions of what teacher education aims to achieve and how. This is especially troubling considering the urgent need to grapple as a field with racism and whiteness, which requires establishing both clear learning goals for teacher candidates and learning experiences capable of facilitating candidates’ learning to practice responsive, anti-oppressive teaching.

This course, therefore, would aim to equip NTEs to center teacher learning in their own work. In particular, the course would introduce NTEs to, and/or build on existing knowledge from previous doctoral coursework on, a range of learning theories that could be applied to the study and practice of teacher education. A possible assignment for facilitating this learning, for example, might expect NTEs to critically analyze existing scholarship and local practices through the lens of learning theories and frameworks. Such an assignment would provide NTEs with opportunities to discern how different conceptions of learning and approaches to teacher educating may be conducive to preparing equity- and justice-oriented teachers, capable of exercising pedagogical judgment. A subsequent assignment, meanwhile, might challenge NTEs to link learning theory with program and course design. NTEs, for example, could be encouraged to draw across dilemmas of practice from their own teacher educating and various learning theories to craft possible course and program designs for facilitating teacher candidates’ equity- and justice-oriented learning.

Pedagogies of equity- and justice-oriented teacher education

No area of teacher educator development has received more attention in the literature than the pedagogy of teacher education (e.g., Goodwin and Kosnick, 2013; Korthagen, 2020; Loughran, 2006). Indeed, many have suggested that the ability to formally prepare teacher educators depends on codifying the knowledge necessary for teacher educating (Grossman et al., 2009).

Yet, there are contradictions inherent to identifying a universal knowledge base if the aim of teacher educator preparation is to transform teacher education rather than perpetuate its current structures and practices. Put another way, what might be the limitations of supporting teacher educators to dismantle the profession’s current architecture, to re-envision how and what the profession could be, using a knowledge base drawn from the profession as we know it? Relatedly, there is good reason to question the very premise of a universal knowledge base for teacher education given the transformative learning that can emerge when NTEs center their own subjectivities to co-construct teacher educator knowledge “from the ground up” (Stillman et al., 2019a,b).

The challenges and rich debates surrounding the codification of a knowledge base for teacher educators, alongside tendencies to treat disciplinary expertise as sufficient qualification for teaching teachers, are a few key reasons why a course dedicated to the critical exploration of teacher education pedagogies is essential to teacher educator preparation. Additional reasons include widely accepted understandings that teaching and teacher educating are distinct activities (Feiman-Nemser and Buchmann, 1985), since becoming a teacher educator requires learning about both “first-order,” K-12 classroom teaching, and “second-order” teaching, or teaching about that teaching (Murray and Male, 2005). Like Korthagen’s (2020) argument that challenging the status quo in teacher education hinges on critical understandings of teacher education pedagogy, I argue that efforts to transform teacher education into a more equity- and justice-oriented enterprise rests on teacher educators’ dynamic and critical pedagogical knowledge. Indeed, teacher educators must also exercise their own pedagogical judgment (Horn and Campbell, 2015) as they make contextually sensitive decisions about how to prevent and respond to racism and whiteness in courses and beyond.

Within an anti-racist teacher educator preparation program, any course on the pedagogy of teacher education would need to help NTEs deepen their knowledge of first-order teaching for equity and justice through opportunities to both unlearn allegedly “best practices” now understood to advantage white, English dominant students, and to engage in deep learning about multicultural education and culturally sustaining and critical approaches to teaching. Since these pedagogies continue to evolve, and NTEs bring with them a diverse range of identities, knowledges, experiences, and lived realities, learning experiences would need to make space for and leverage varied degrees of expertise and understanding.

This course would additionally offer learning experiences designed to foster collaborative, critical explorations of second order equity- and justice-oriented teaching. Korthagen (2020) recently outlined widely accepted teacher education pedagogical strategies, such as case methods (Richert, 1991), video analysis (van Es and Sherin, 2010), promotion of reflection (Zeichner and Liston, 2013), teacher identity work (Britzman, 2003), and practitioner research (Cochran-Smith and Lytle, 2009), among others. Although these approaches were not derived with the intention of moving teacher candidates toward anti-racist teaching, critically exploring them could provide NTEs with opportunities to consider how they stand to perpetuate race-neutral teacher education (Brown, 2014) or other forms of oppression, and/or open possibilities to stimulate anti-oppressive teaching. As one example, although Korthagen (2020) and others have lauded approximations of practice (Grossman et al., 2009) as a promising pedagogy for all, others have raised concerns about the pedagogy’s potential to impose harm on students from non-dominant communities (Beltramo et al., 2020; Daniels and Varghese, 2019; Philip et al., 2018).

While a more general approach to teacher educator preparation might stop with these widely accepted pedagogies, a program designed to facilitate equity- and justice-oriented NTEs’ development would require NTEs to explore pedagogical strategies focused on anti-racist teacher education (e.g., see Picower, 2021). Conklin (2015, 2020), for example, found that within her own doctoral course on the pedagogy of teacher education, identity circles, autobiographies, and modeling love and compassion seemed to have the greatest impact on NTEs’ equity- and justice-related learning and practice.

In addition, a burgeoning area of scholarship—much of it produced by scholars of color—offers pedagogical strategies explicitly geared toward preparing equity- and justice-oriented teachers. Some examples include principled improvisation (Philip, 2019), race-based caucuses (Varghese et al., 2019), language autobiographies (Athanasios et al., 2019), horizontal partnerships between teacher educators, and teachers and children of color (Souto-Manning and Martell, 2019), pedagogical rehearsal that cultivates epistemic disobedience (Dominguez, 2021), and humanizing pedagogy (Carter-Andrews et al., 2019). To deepen their understandings of these strategies, NTEs could identify dilemmas of practice related to equity and justice and then select a justice-oriented pedagogical strategy to address the dilemma in context. NTEs could then critically analyze the strategy’s use with their own teacher candidates.

Finally, there is some evidence to suggest that an especially challenging and prevalent aspect of equity- and justice-oriented teacher educating involves disrupting such thinking about minoritized students and their communities (Conklin, 2020; Stillman and Beltramo, 2019; Stillman et al., 2019a,b). Although the pedagogical strategies above aim to dismantle deficit framings, opportunities for teacher educators to disrupt such framings also regularly emerge in course discussions and while providing candidates with feedback. This complex mediational work isn’t intuitive, and like other dimensions of teacher educating, requires supported opportunities for NTEs’ critical exploration and practice. As described below, critical inquiry communities offer especially rich learning contexts for this work.

Critical inquiry communities

Supporting teacher educators as practitioners *and* researchers is crucial to any effort to improve the profession. Indeed, many teacher educators’ survival in academe depends on their success in publishing new research. Yet, teacher educators’ working conditions—including heavier than typical teaching loads (Zeichner, 2014)—coupled with tendencies to treat research and practice as distinct (Goodwin et al., 2014)—can constrain teacher educators’ capacities to remain research active. These are all good reasons to include in preparation efforts experiences that cultivate NTEs’ comfort with and commitment to doing teacher education research.

When teacher educators link their research and practice it can also cultivate transformational change (Goodwin et al., 2014). In particular, practitioner inquiry holds promise for facilitating teacher educators’ un-learning and critical identity development—both of which are central to advancing social justice goals (Cochran-Smith et al., 1999). However, Cochran-Smith and Lytle (2009) caution that engaging in practitioner inquiry does not necessarily challenge oppressive systems, structures, and practices, and can just as easily bolster them. For example, teacher educators often elect to engage in self-study so that they can meet publication demands despite limited funding or ample time for other types of research, rather than pursuing self-study to engender genuine learning and change (Cochran-Smith and Villegas, 2016). Cochran-Smith and Lytle (2009), thus, suggest that teacher educators participate in inquiry communities to ensure a critical lens anchors their investigations.

Recognizing the powerful learning that can happen outside of formal courses and within professional communities, this third design component aims to deepen and extend NTEs’ learning from formal coursework, by providing opportunities for NTEs to ground learning in critical investigations of their own teacher educating practice. The community would operate as a dynamic requirement throughout NTEs’ doctoral education, providing a venue to share dilemmas of practice, conduct individual and/or collaborative self-studies, and engage in collective sensemaking. To bring structure, purpose, and criticality to such as space, I propose drawing on critical pedagogical approaches.

In my own work, I have illustrated the potential of Culture Circles (Freire, 1970) and Theater of the Oppressed (*teatro*) (Boal, 1979) to ensure criticality within inquiry communities for equity- and justice-oriented NTEs. Structuring participation according to

Freire's Critical Cycle (Freire, 1970; Souto-Manning, 2010), for example, can support NTEs to: identify dilemmas of practice centrally concerned with equity, justice, and teacher learning; draw connections across questions and dilemmas of practice; co-construct knowledge for teacher educating grounded in their situated identities and experiences; and engage in critical, collective reflection and problem solving geared toward action (Stillman and Beltramo, 2019; Stillman et al., 2019a,b).

But, as Ohito (2020) points out, to enact anti-racism in practice, teacher educators also need experiences that facilitate embodied learning, since possessing an anti-racist ideology does not necessarily lead to anti-racist behavior. *Teatro*, coupled with Culture Circles can facilitate this sort of embodied learning. Specifically, *teatro* has been shown to produce learning intimately tied to NTEs' identities; to help NTEs develop and rehearse using tools for addressing equity- and justice-related challenges; and to cultivate NTEs' courage for challenging deficit ideologies and oppressive systems and structures (Stillman et al., 2019b; Beltramo et al., 2020).

Since transforming teacher education depends upon all participants' learning and improvement, this space would ideally be cross-generational and cross-contextual, including NTEs at varying stages of development, existing university teacher education faculty, and school-based teacher educators. Cross-generational learning is especially crucial in teacher educator development efforts since "practicing teacher educators apparently do not feel adequately prepared for diversity, while ... less experienced teacher educators were more likely to consider diversity and multicultural issues as more important than their more experienced peers" (Goodwin et al., 2014, p. 297). Thus, unlike traditional mentoring relationships whereby allegedly more knowledgeable veteran practitioners support novices, this arrangement would nurture bi-directional relationships and learning. Rotating facilitation each session would help to foster horizontal participation, ensuring all participants are positioned as expert and can develop a sense of ownership and leadership, and would allow for the privileging of multiple perspectives, identities, and topics.

Discussion

In this chapter, I have argued that for teacher education to become an equity- and justice-oriented field, authentically answerable to the communities of color it claims to serve, we must invest in the preparation of equity- and justice-oriented teacher educators. After describing how oppression and injustice, particularly related to racism and whiteness, manifest in US teacher education programs, I proposed a three-pronged framework for a specialized doctoral curriculum. Anchored in the situated learning theories of critical pedagogy and CHAT, the proposal offers recommendations for contextualized, future-oriented, and embodied learning experiences aimed at equipping equity- and justice-minded NTEs for the complex work needed to spark change in the profession.

In particular, the hypothetical learning experiences described are designed to support NTEs' engagement in collective problem solving and reflection, guided by course-generated understandings and grounded in dilemmas from NTEs' lived realities and teacher educating. These learning experiences, designed to foster NTEs' development of knowledge of teacher educating, reflect Cochran-Smith and Lytle's (1999) conceptions of teacher learning, as applied to teacher educator learning (Goodwin et al., 2014). My hope is that these recommendations expand discussions about how teacher education and teacher educators are implicated in the perpetuation of racism and other forms of oppression, and catalyze critical dialog about, and action focused on, teacher educator preparation as a lever for creating a different, more just future for the field.

This isn't to suggest that the existence of teacher educator preparation programs can alone resolve teacher education's historically sedimented problems. For one, teacher educator preparation cannot on its own mitigate the harms that a predominately white teacher educator workforce imposes. Without any doubt, hiring and supporting more teacher educators of color is essential to teacher education's transformation (Brown, 2014; Picower and Kohli, 2017; Teachers of Color Collective and Souto-Manning, 2022). Teacher educator preparation can begin to address this problem by recruiting into specialized doctoral programs students of color interested in anti-racist teacher educating. However, just as diversifying the teacher candidate population leaves teacher education's racist roots intact (Brown, 2014), diversifying the teacher education faculty without providing effective preparation or support, while also making other changes—including pressing and supporting white teacher educators to change—cannot eradicate the racist conditions and practices that characterize the profession.

As noted earlier, myriad institutional factors also uphold the field's predominance of whiteness and perpetuation of racism. Inadequate resources, teacher educators' heavy teaching loads and under-compensation, universities' reliance on teacher education to generate revenue, and neoliberal policies all pose challenges to building and sustaining effective, justice-oriented teacher education programs. Although teacher educators can address these problems, time and experience have proven that their efforts alone cannot overcome them.

Of course, these conditions raise questions about the degree to which equity- and justice-oriented transformation in teacher education is even possible. But acknowledging these conditions also provides insights for cultivating teacher educator preparation's success. Figuring out how to make teacher educator preparation a fixture of the profession is critical, as it is hard to imagine any fundamental change occurring without investment in teacher educators' learning—learning that would position teacher educators to generate disruption and transformation from within (Ellis, 2018; Jóhannsdóttir, 2010). This investment will need to take multiple forms.

For one, institutions must recognize and compensate faculty for the actual work required to develop and sustain programs. While the proposed curriculum includes traditional components, like courses, for which faculty can expect compensation (as part of their assigned teaching loads), like teacher education, the curriculum also includes necessary, but less traditional and, therefore, less visible roles and responsibilities. A few clear examples include multi-year faculty mentoring roles and the critical inquiry community convener, for which faculty are less likely to receive compensation. These responsibilities take enormous time and

energy and cannot simply be added teacher educators' existing workloads (Gunn et al., 2016). Thus, it would behoove faculty to preemptively—during program development—identify and make official the many roles and responsibilities that teacher educator preparation demands so that they can be accounted for when assigning courses and service responsibilities.

Institutions must also invest in their existing faculty's learning. Few universities have concentrations of faculty with the knowledge, expertise, and will needed for designing and running preparation programs for equity- and justice-oriented NTEs. In addition, most current teacher educators have fallen into the profession themselves, likewise learning on the job without structured opportunities to study the profession or their own practice. Recent research indicating that much of the predominately white teacher educator force is not knowledgeable about or interested in learning about multicultural education and diversity only compounds these issues (Goodwin et al., 2014).

These realities suggest that investing in the learning of practicing teacher educators is equally as important as developing the profession's next generation. Some such opportunities can be built into teacher educator preparation programs, for example, through the creation of cross-generational learning spaces like the critical inquiry communities described earlier. But to transform the field, practicing teacher educators additionally need access to and support for engaging in a range of professional learning experiences centered on anti-racist teacher education and critical examinations of their own practice, all with an eye toward how they would mentor others into the field.

Conclusion

If we hope to transform teacher education, teacher educator preparation is essential, and will require greater investment in the field. But these investments are not just about workloads, compensation, and learning opportunities, though all matter greatly. Rather, investments must also involve changing the nature of the profession through the humanization of teacher educators. Students from the doctoral program for NTEs at my own institution perhaps made this point best in an article they coauthored after conducting practitioner inquiry projects while engaging together in Freirean Culture Circles and Boalian theater (Freeman et al., 2020).

In the article they recount their own struggles to humanize teacher candidates at a predominately white institution, when so many of them expressed deficit ideologies, often about these NTEs' own communities. Through their individual inquiries and collective sensemaking, these NTEs began to link their own capacities for humanization to the degree to which they felt humanized in their own learning. They ultimately argued that the humanization of teacher educators is crucial to advancing teacher education toward equity and justice.

I sincerely hope that investing in the next generation of teacher educators not only sets the stage for transforming teacher education into a genuinely anti-racist enterprise, but that the next generation of teacher educators also experiences a better, more humanizing work life than the generations before them. Investing in teacher educators' learning and treating the profession as worthy of such support, is a step in that direction.

Acknowledgments

Many of the ideas in this manuscript represent collective thinking with valued colleagues, especially Dr. Melissa Braaten and Dr. Mariana Souto-Manning. I also extend my deepest gratitude to former and current doctoral students/NTEs at the University of Southern California and the University of Colorado Boulder, with whom I have had the distinct privilege to work and learn. Your brilliance, passion, and hard work move us closer to a more just and equitable world.

Introduction

The self-study of practice has established itself as a robust approach to teacher education. The field was established in 1993 by teacher educators, who established the Self-Study of Teacher Education Practices (S-STEP) Special Interest Group of the American Educational Research Association (see [Loughran, 2004](#)). This practitioner research group, which initially borrowed theoretical conceptions and research methods from other fields, has over the past thirty years developed a rich literature on the practices of teacher educators working within their institutional contexts. S-STEP is the most common term for this field, as evidenced in the title of its leading journal, *Studying Teacher Education: A Journal of Self-Study of Teacher Education Practices*. At times, the term is extended to include teachers, as in the *International Handbook of Self-Study of Teaching and Teacher Education Practices* ([Loughran et al., 2004](#)) and the second edition ([Kitchen et al., 2020](#)). The term self-study of practice is employed, as in *Research Methods for the Study of Practice* ([Tidwell et al., 2009](#)), to widen the circle to include practitioners in higher education and the professions. This chapter, which builds on Tom [Russell's \(2010\)](#) overview of self-study in the third edition of this encyclopaedia, focusses primarily on how self-study aims to improve preservice teacher education practices.

Self-study and enacting a pedagogy of teacher education

In "Self-Study by Teacher Educators," [Russell \(2010\)](#) framed self-study as a response to the challenges of learning to teach. Building on fundamental problems identified by [Darling-Hammond \(2006\)](#), he wrote:

One broad conclusion that can be drawn from these researchers is that teacher education is far more complex than it has commonly been taken to be, if we consider the short period of professional preparation relative to other professions and if we consider the lack of explicit attention to the problems of apprenticeship of observation, enactment, and complexity. When self-study of teacher education practices arrived on the landscape of teacher education, it was with a strong sense that teacher educators themselves must look within.

[Russell \(2010, p. 690\).](#)

This was followed by brief profiles of four leading self-study practitioners who had attempted to develop, enact and research teacher education practices that were responsive to the complexities of teacher education and summaries of two significant documents on self-study methodology.

John [Loughran \(2006\)](#), one of the practitioners profiled by Russell, articulated the case for the development of a pedagogy of teacher education through which teacher educators understand teaching and learning about teaching. He argued that "students of teaching need to be able to see and hear the pedagogical reasoning that underpins the teaching they are experiencing" (p. 5). Teacher educators, he proposed, need to purposefully and explicitly examine the complex interplay among elements within courses and across a program in order to go beyond transmission of knowledge and modeling practice:

Unpacking teaching in ways that give students access to pedagogical reasoning, uncertainties and dilemmas of practice ... to make clear how the teaching approach purposefully encourages learning and how learning influences teaching in action. (p. 6)

Self-study, for Loughran (2005), is “a meaningful way for uncovering important facets of the knowledge of practice” as it helps teacher educators “capture, unpack and portray and the complexities of teaching and learning about teaching in ways that might lead to deeper understandings of practice” (p. 13). “The S-STEP community,” through its collaborations, conferences and publications, was regarded by Loughran (2004) as “an important audience” that supports, critiques, models and mentors (p. 29) teacher educators in enacting a pedagogy of teacher education. It also fosters “development in critical and useful ways so that the learning through self-study might be informative, accessible and useable for others” (Loughran, 2004, p. 32).

What is self-study?

The term *self-study of teacher education practices* is often abbreviated to *self-study*. This is understandable but it is wise to regularly remind oneself to complete the term. An alternative is to substitute the acronym S-STEP.

The first word, *self-study*, conveys that the *self* is engaged and directing in the *study*. Many institutions, such as universities and professional regulatory bodies, use the term “institutional self-study” to refer to comprehensive internal reviews aimed at improving programs (e.g., [Liaison Committee on Medical Education, 2017](#)). The abbreviated version of S-STEP is reasonably accurate in conveying that teacher educators engaged in this approach to practitioner inquiry are studying their practice in order to become more effective at their work. Indeed, they are both the researchers and the subjects of their studies.

The self, however, is more personally engaged in S-STEP than in institutional self-studies. Teacher educators are inquiring into their professional practices and, often, engaged in *reflection-in-action* (Schön, 1983). As [Martin and Russell \(2020\)](#) wrote, “self-study of teacher education practices is a metacognitive and reflective practice conducted by teacher educators learning from experience” (p. 1049). Undergirding much of self-study is the view that “teaching experience is acquired by investing time in the context of professional action; learning from experience demands reflection-in-action as an alternative frame of reference for personal learning” (p. 1059).

Many S-STEP researchers go beyond reflecting in and on action by also considering their personal and professional identities. They recognize, as [Connelly and Clandinin \(1988\)](#) articulated, that “‘personal knowledge’ ... determines all matters of significance relative to the planned conduct of classrooms” (p. 4). This leads many to engage, to varying degrees, in personal history, narrative and autoethnographical approaches to self-study ([Samaras, 2002](#)). As co/autoethnographers [Coia and Taylor \(2009\)](#) wrote, “Our pedagogical choices, our perceptions of the challenges we face, all involve our values, beliefs, and prior experiences” (p. 5). Coia and Taylor, in the next sentence, cautioned “clearly that is not all that is involved (p. 5). They then acknowledged their subjectivity and “the impact of the world on constructing the personal” (p. 5).

[Loughran \(2004\)](#), in his history of self-study, stressed the importance of collaboration in “the checking of data and interpretations” (p. 20) and “framing and reframing” (p. 21) understandings. As a result, collaboration and critical friendships have increasingly become means of demonstrating trustworthiness in self-study ([Schuck and Russell, 2005](#)).

Study conveys that S-STEP is a research method. Researchers collect and analyze information in order to more deeply understand themselves and their practices, students and contexts. Most practitioners are guided by an understanding of teacher knowledge as “knowledge that comes from experience ... learned in context, and ... “expressed in practice” ([Clandinin and Connelly, 2004](#), p. 579). [LaBoskey \(2004\)](#) identified “self-initiated and focused” as one of the predominant characteristics of self-study. Through self-study methods, teacher educators consider multiple dimensions as they “provoke, challenge and illuminate” on their paths to “hard won, elusive, and generally more tentative” ([Bullough and Pinnegar, 2001](#), p. 20) conclusions about their lived experiences in practice settings.

Teacher education is the context in S-STEP, although there are also self-studies of teaching, higher education and other professions ([Kitchen, 2020c](#)). Self-study, however, acknowledges that each local context is different and that the practitioner is well positioned to understand and adapt to contextual factors. More importantly, it helps teacher educators “maintain a focus on their teaching and their student’s learning” while also being “informative, accessible and useable for others” ([Loughran, 2004](#), p. 31).

As practitioner researchers, teacher educators in S-STEP are interested in identifying effective *practices* that prepare graduates to be successful teachers. As [Loughran \(2006\)](#) stated, there is a need to develop a pedagogy of teacher education. In enacting a pedagogy of teacher education, S-STEP teacher educators share with other practitioner researchers an interest in identifying specific practices that work ([Cochran-Smith and Lytle, 2004](#)). The difference is that self-study brings teacher educators to forefront alongside their practices, and calls on practitioners to be critical of their roles as practitioners and inquirers ([Feldman et al., 2004](#)).

S-STEP simultaneously considers all elements of the education included in the term. In practice, however, individual publications may foreground one element. For example, while [Kitchen’s \(2005a,b\)](#) “relational teacher education” is a conception that considers self, students, practice and context in relation to each other, individual articles and chapters often focus primarily on a single piece of the larger puzzle. His body of self-study work includes explorations of his personal and professional identity (e.g., [Kitchen, 2016](#)), methodology (e.g., [Kitchen, 2009](#)), research ethics ([Kitchen, 2019](#)), collaboration ([Kitchen et al., 2008](#)), student voices (e.g., [Kitchen, 2020a](#)), and specific practices (e.g., [Kitchen, 2008](#); [Kitchen and Bellini, 2012](#)).

Theoretical assumptions

Self-study emerged as responses to the technical-rational assumption that research knowledge can be applied to practical problems with little reference to people or context ([Schön, 1983](#)). [Russell \(2004\)](#) argued that “our growing awareness of the importance of *self*

in teacher education" was "not only necessary but also inevitable" (p. 1192) given the failure of the technical rational model to serve the needs of practitioners. This led many educational theorists and teacher educators to consider thinkers such as Dewey, Schwab and Schön who acknowledged the complexities of teaching and learning. Dewey (1938) regarded educative experiences as those that lead to growth through teachers who are responsive to "the situations in which interaction takes place" (p. 45). Emphasizing the centrality of practice, Schwab (1971) claimed that theories are "in the main, ill-fitted and inappropriate to problems of actual teaching and learning" (p. 287). Practical problems for Schwab "arise from states of affairs in relation to ourselves" (p. 189) and, thus, the "method of the practical ... is, then, not at all a linear affair proceeding step-by-step, but rather a complex, fluid, transactional discipline aimed at identification of the desirable and at either attainment of the desired or at alteration of desires. (p. 291). Schön's (1983) offered a new way of approaching the theory-practice by making the case that reflective practitioners in classrooms carry the "authority of experience" (Munby et al., 2001). Connelly and Clandinin's (1988) on the "personal practical knowledge" of teachers' and their authority curriculum-makers also resonated with the founders of S-STEP, as it reinforced the importance of knowing oneself in order to understand and effectively teach students in classrooms (Connelly and Clandinin, 1988).

These and related theories justify research that is initiated by teachers, teacher educators and other practitioners, focused on themselves and their practice (LaBoskey, 2004) in relation to their students (Bullough and Pinnegar, 2001), and grapples with the complexities of practice in real world contexts (Loughran, 2004).

Methodology

Self-study, according to Loughran (2004), began as "a 'coming together' of like-minded people with similar interests, issues and concerns" (p. 13) open to employing "a remarkable range of methods (p. 17) selected based on the "question/issue/concern under consideration" (p. 17). Self-study, according to Bullough and Pinnegar (2001), is a "mongrel" as "the study is always of practice, but at the intersection of self and other and its methods are borrowed" (p. 15). Today, despite a growing body of self-study research, "one of the defining features of S-STEP is its hybridity" (Fletcher, 2020, p. 270). For Fletcher, this hybridity is evident in the theoretical frames, analytical tools and methodologies (and methods) used. Common methods used in S-STEP include reflective practice; narrative inquiry, personal history and autoethnography; action/teacher/practitioner research; dialogic communities, portfolios; and arts-based inquiry. (Loughran, 2004; LaBoskey, 2004; Fletcher, 2020).

While hybridity and an interest in coming together are strengths, they exist in tension with calls for academic rigor. LaBoskey (2004), in "The Methodology of Self-Study and Its Theoretical Underpinnings," addresses the need for well-conceptualized and executed research design. She identifies five criteria for designing and assessing self-studies:

- *Self-initiated and focused*: teacher educator as "both who is doing the research and who is being studied (p. 842);
- *Improvement-aimed*: "evidence of progress and ... adjustments to our understanding of practice" (p. 859);
- *Interactive*: "interactions with our colleagues near and far" (p. 859), including students, critical friends and educational literature;
- *Multiple, primarily qualitative, methods*: "competent use ... of multiple methods ... to gain different, and thus more comprehensive perspectives" (pp. 859–860);
- *Exemplar-based validation*: "formalize our work and make it available to our professional community for deliberation, further testing, and judgment" (p. 860).

Similarly, in order to promote rigor, Bullough and Pinnegar (2001) identified guidelines for autobiographical writing in self-study, including that it "ring true," "promote insights and interpretation," "take an honest stand," and help "improve the learning situation not only for the self but for the other". (pp. 16–17).

The importance of methodological rigor in self-study today is nicely summarized in "Methods and Tools of Self-Study" by Tidwell and Jónsdóttir (2020):

Self-study is a methodology that offers a variety of research designs and methods that often challenge the known, and push researchers to think deeper about their own practice, their own context, and their understanding about the complex roles in and purposes of education. ... As the qualitative nature of self-study and its ingrained call for social justice and change often disrupts and deconstructs what is known, pushing further into the unknown, it opens the possibilities and need for more creative and innovative approaches to the study of practice ... It is critically important for self-study research to include the theoretically grounded research question(s), the data choices and collection process, and the data analyses used to make meaning of the data. It is this full reporting of the data process that enables us to make sense of what we know, and that enables us to confirm the efficacy of our research practice. (p. 418)

Self-study's hybridity and commitment to rigor provide both a firm foundation for future research and the flexibility to adapt to changes in the field of education.

How does self-study improve teacher education practices? Four exemplars

S-STEP as a discourse community engages in the collective development of knowledge. Given the focus of self-studies, the common purpose is to improve teacher education with a view to enhancing student learning in schools. Articles and chapters in self-study

play an important role in advancing this agenda. In this section, four articles published in *Studying Teacher Education* are considered as exemplars of how self-study improves teacher education.

Reconceptualizing teacher knowledge as tensions

Dewey, Schwab and Schön were among the theorists who inspired teacher educators to study their practices and make sense of the complexities of teaching and learning in teacher education and beyond. Amanda Berry, in an effort to improve her practice, grappled with “the ambiguities and complexities inherent in teacher educators’ work” (Berry, 2007a, p. 121). This led her to reconceptualize and reframed “tensions” as “an analytic tool for studying practice. Berry (2007b), in *Tensions in Teaching about Teaching: Understanding Practice as a Teacher Educator*, identified six tensions that together offer “a helpful frame for interpreting and organizing teacher educators’ accounts of their experience (2007a, p. 120). In “Reconceptualizing Teacher Educator Knowledge as Tensions: Exploring the Tension between Valuing and Reconstructing Experience,” one of the ten most cited in *Studying Teacher Education* (Kitchen and Berry, 2020), she focused on one of these tensions illustrate how this frame can serve to draw out the complexities of practice, The impetus for Berry’s self-study was “the dissonance created between what [she] sought to do in [her] sought to do in [her] teacher education practices and the means taken to achieve [he] goal” (Berry, 2007b, p. 118). Recognizing the limitations of her “pedagogy-of-presentation,” she sought to develop “a pedagogy of teacher education ... consistent with the view of learning [she]was presenting in teacher education, that high school students needed opportunities to construct their knowledge of biology through engaging in the process of meaning making for themselves” (p. 118). Berry’s self-study methodology for this inquiry was rigorous and hybrid. Her data sources included an autobiographical account of her experiences, videotaped lessons, journals, field notes, observations by colleagues, student assignments and correspondence with a teacher candidate.

The main significance of this study was the emergence of “tensions” as a conceptual frame and analytical tool. Berry wrote:

Analysis of the data developed alongside a review of the research published by other teacher educators also motivated to study their practice. I recognized similarities between my own experiences and what these teacher educators reported from their practice. I also saw a broader framework that connected these elements of teacher educators’ practice. It was apparent that teacher educators regularly experienced particular *tensions* as they attempted to manage complex and conflicting pedagogical and personal demands within their work as teachers of prospective teachers. The notion of tensions offered a useful way of describing teacher educators’ experience of their practice (including my own). It captured well the feelings of internal turmoil experienced by teacher educators as they found themselves pulled in different directions by competing pedagogical demands in their work and the difficulties they experienced as they learnt to recognize and manage these demands. (p. 119)

While the recognition of tensions is not unique to Berry, her framework and six illustrations make these tensions. This articulation, by both aiding recognition of tensions and offering insights into managing them, has aided many teacher educators in their research and practice (e.g., Kitchen and Bellini, 2012; Kitchen, 2020a).

The body of the article explores the tension between valuing “personal experience in learning to teach” and challenging those experiences “in ways that move [teacher candidates] beyond simply (re)confirming their existing beliefs about teaching and learning” (Berry, 2007b, p. 121) experience. Berry then drew on her data sources to explore how this tension played out in both “deliberate pedagogical structures” (p. 121) such as a personal learning review (teacher candidate responses to questions about their schooling in sciences), a drawing task, and peer microteaching. In parallel, she considered new approaches to reconstructing experience through “through an unplanned activity of sharing experiences of teaching with Lisa, a student in the class” (p. 121). The email correspondence with Lisa served as valuable for of interaction that provided Berry with insights into issues and validated thinking about her enactment of teacher education pedagogy (LaBoskey, 2004).

The article concluded with Berry considering how this research, particularly the idea of tensions, contributes to self-study and teacher education. She emphasized the importance of sharing both “phronesis” (personal perceptions) and “episteme” (findings) with a wider discourse community o as to improve teacher education pedagogy and programs. As tensions “serve both as a language for describing practice and as a frame for studying practice” (Berry, 2007b, p. 132), it is helpful in capturing and holding the complexities of practice without reducing or resolving them. This contribution makes “Reconceptualizing Teacher Educator Knowledge as Tensions” an exemplar of theory that illuminates teacher educator identity and improves self-study practice.

Self-study, critical friendship, and the complexities of teacher education

A second way in which self-study improves teacher education is by providing practitioner with methodologies that draw out their insights as teacher educators and make them accessible to others in the field. As LaBoskey (2004) noted, interactivity with others is an important research design characteristic of self-study. One means of collaborating with others is through critical friendships in which two or more teacher educators interact personally and professionally to make sense of individual or shared experiences as revealed in research data and analysis. “Self-Study, Critical Friendship, and the Complexities of Teacher Education” by Schuck and Russell (2005), the most highly cited article in *Studying Teacher Education* (Kitchen and Berry, 2020) exemplifies how a self-study article can improve research practice.

Sandy Schuck and Tom Russell “as teacher educators in Australia and Canada” joined together as critical friends out of a shared concern “with studying and improving our teaching” (p. 107). Tom “enlisted Sandy’s aid as a critical friend for one semester” (p.

117) to help him make sense of “an unexpected teaching assignment” (p. 117) in secondary school science classes. He hoped that Sandy’s insights from afar would help him make sense of the data and construct meaning. Soon after, Tom took the opportunity to work at Sandy’s university, thus affording Sandy the opportunity to engage Tom as a critical friend to observe and help make sense of her mathematics lessons.

The article, after a brief introduction, begins by identifying problematic issues and assumptions about critical friendship that emerged from their collaboration. They identify “the difficulty of assessing one’s own practice and reframing it” (p. 108) as a problematic issue. This means that it is vitally important that the critical friend be trusted, supportive, and willing to ask provocative questions. While both were willing to engage in this manner, implicit assumptions emerged that needed to be addressed. The first was that Sandy was unsure how to meet Tom’s expectations of a critical friend. The second was that Sandy had to confront her perception that she possessed lower academic status, even though these “issues, that were quite significant for Sandy, were distant or invisible for Tom” (p. 109).

The body of the article consists of data collection and analysis of the first phase involving Tom’s teaching, followed by a summary of outcomes and consideration of insights. A similar structure was then employed for the second phase on Sandy’s university teaching. These sections of the paper are rich in detail on their experiences, the data collection process, and the lessons learnt. Excerpts from their reflective journals bring the experiences and interactions to life. They “show” more than “tell” how a critical friendship is experienced. By identifying the problematic and making it front-and-centre, they help the reader grapple with the complexities of developing authentic critical relationships.

In offering insights into how their critical friendships might be improved, they wrote:

The issue of how best to act as a critical friend continues to intrigue us. Supportive and encouraging comments are more easily received than ones that challenge our thinking and beliefs. We both experienced this in the role of the practitioner, and we both wondered how best to challenge gently as the critical friend. (p. 117)

This led Sandy and Tom to construct meaning to be shared from their experiences over the two phases. They identified differences between face-to-face interactions and one’s by email from a distance. While email ensured a detailed record, the types of observations and interaction is limited by the control over the themes to be explored. They also contrasted teaching with critical friendship, noting similar commitments to relationship and growth, yet a need for the critical friend to be both sensitive and critical. Particularly significant for them was the “dichotomy between being told new insights and working out new insights for oneself” (p. 119). They ended with eleven conclusions about critical friendships within teacher education and self-study that are evident from data shared and, based on its citation record, helpful to teacher educators engaging in critical friendship.

Schuck and Russell’s account provide insights into the experience of being in a critical friendship. The conclusions offer valuable takeaways on how employ this methodology. The article is also a model of working through the complexities of teacher education through self-study, as it is clearly improvement-aimed, interactive, validated by exemplars, and varied in the qualitative methods used while remaining real and accessible.

From teacher to teacher educator

Teacher educators are drawn to S-STEP by their interest in improving their professional practice. Novice teacher educators experience a genuine need for guidance, especially as there is little formal preparation in developing and enacting a pedagogy of teacher education (Loughran, 2006). Half of the ten most cited articles in *Studying Teacher Education*, including the two-part “From Teacher to Teacher Educator” study by Todd Dinkelman et al. (2006a,b), relate to becoming a teacher educator (Kitchen and Berry, 2020).

These two articles report on “a study of two beginning teacher educators making the transition from classroom teacher to university-based teacher educator” (Dinkelman et al., 2006a, p. 5). The two novices, Jason and Karl, were supported by Todd, a university-based teacher educator and researcher. The first article, “From Teacher to Teacher Educator: Experience, Expectations, and Expatriation,” reported on their questions, framing within research literature, and methodologies, as well as results related to “their institutional context and shifting role identification” (p. 5). The second, “From Teacher to Teacher Educator: Reframing Knowledge in Practice” (Dinkelman et al., 2006b), built “on these insights by addressing the frames of understanding and knowledge employed in this transition and by describing how these frames informed decisions in the arena of teacher education practice” (2006a, p. 5). The began by identifying a dearth of research on the professional development of teacher educators and, in particular, the challenges for those transitioning from elementary and secondary school teaching. They identified S-STEP as “the most powerful impetus for the growing body of research into the development of teacher educator identity, competence and practice” (2006a, p. 7), before framing their work in relation to the teacher socialization literature. The authors identified case study as their primary methodology, with weekly reflective journals and semi-structured interviews being key data sources to be coded.

Three common themes are the focus of the study. First, as graduate students engaged in teacher preparation, they found the institutional context to be both supportive and challenging. It was supportive in that it offered time for reflection and, through Todd’s mentoring, support in making the transition. On the other hand, they felt challenged by “an environment that simultaneously valued and devalued their work” (2006a, p. 14) and lacked education and professional guidance on the day-to-day practice of teacher educators.

Second, they were challenged by their shifting role identification. While their classroom experience formed a strong foundation for their university work, the two identities did not always correspond. Karl reflected in an interview:

Becoming a teacher educator is more complicated ... I'm trying to think at the same time about whether or not I'm practicing what I'm preaching ... So the process, this becoming process is a lot more complicated for me, than the process of becoming a teacher was ... They are also complicated by the fact I'm doing many things at the same time. (2006a, p. 20)

They were discovering, as Loughran (2006) was conceptualizing at the time, that teachers modeling practice was not enough, that teacher education required a different identity and a different pedagogical stance.

Third, as outlined in the second part, Karl and Jason needed to reframe their understanding and knowledge in order to successfully transition to teacher education. This extended section is broken into nine subsections, including *street credibility and survival strategies* (e.g., drawing on prior experiences as teachers and using these to demonstrate credibility); a shift from *learning by doing* to *learning by thinking* thanks to reflection on their teacher education practices: *reframing puzzles* through their journaling and meetings as part of this study; a dearth of formal opportunities to learn how to become a teacher educator in graduate programs; and the importance of *modeling* as teacher educators not just as teachers. Specific examples from journals and interviews demonstrate Jason and Karl's growth and give texture and nuance.

The second article ends with an extended discussion section that considers several important themes. The first is an exploration of the need to better prepare novice teacher educators through graduate courses that help them develop a pedagogy of teacher education. This is followed by consideration of how to most effectively draw on the sources of knowledge derived from teaching in schools. Finally, the authors reflect on the shifting of professional identity from that of teacher to teacher educator: "What is at stake if teacher educators identify with one world or the other?" (p. 133).

These articles are particularly important as they offer insights, supported by artifacts of experience, into how to transition from teacher to teacher educator. The article concludes by reminding readers that the "initial experience of doing teacher education is a powerful force in shaping the professional practice of teacher educators over their careers" (p. 135). Thus; research is vitally important as a means of understanding novice teacher educators and identifying effective approaches to helping them develop and enact a pedagogy of teacher education.

Providing students with written feedback on their assessment

While many S-STEP articles focus on the teacher educator identity and presentation in teacher preparation programs, other studies begin with a problem of practice—for example, feedback on reflective writing (Kitchen, 2008) or teaching about queer issues (Kitchen and Bellini, 2012)—or a strategy for more effectively delivering content or skills, such as exit cards (Kitchen et al., 2020). A good example of this is "Providing Students with Written Feedback on Their Assessment: A Collaborative Self-Study Exploring the Nexus of Research into Practice" by Sharon Pittaway and Tony Dowden (2014).

The authors begin by identifying "dissatisfaction with written feedback on their assessment" as "a perennial concern in university learning contexts" (p. 197). The article that follows addresses improving the quality of written feedback through the practice of Pittaway and Dowden over five years. Whereas most such studies are modest and local, this study took place in two institutions, over five years, involved the collection of demographic data, and was supported by a teaching development grant. What makes this a self-study is that the authors, in addition to drawing on data, engaged in reflective writing on their respective pedagogical practices and documented in detail their professional conversations over those years. Through these processes, Sharon and Tony explored their "beliefs and practices and the ways these changed and developed as a result of [their] professional conversations" (p. 201).

The analysis of their growth that each provides is rich in complexity and offers insight into the value of studying one's practice. Sharon's account speaks to the value of shifting through self-study from "being the teacher" to "being the learner" (p. 203). This led her to be "more specifically aware of [student] experiences and perceptions or, put differently, I took more notice of their voices" (p. 202). This, among other learnings, inspired her to expand her feedback vocabulary, craft feedback of greater clarity and precision, and led her to structure her course so that "there is ample opportunity to provide [formative] feedback on technical aspects of writing during weekly discussion forums" (p. 204), as well as general feedback posts, and specific responses to individual students. Tony too grew substantially through reflection and professional conversations. The "revelation" for Tony was that he became "definitely more attuned to the whole notion and purpose of feedback and feed-forward" (p. 205). He wrote in his critical reflection that "There has been a sea-change in my practice as I've realized this old-school approach not only doesn't wash; it actually does more harm than good" (p. 205). Self-study led him to the revelation that "full and accurate critique" is not sufficient, that "emotion and cognition mediate each other and, therefore, it is [his] professional responsibility to provide feedback that students will find acceptable, helpful and supportive" (p. 206).

This article is notable as an exemplar of self-study in at least three respects. First, it highlights the value of deeply examining a particular practice. Second, it demonstrates the value of conducting self-study in parallel with other research approaches, as the authors published related studies in assessment journals. Third, in the spirit of self-study as a collaborative venture, through the "collaborative and occasionally confrontational nature" of their research, Pittaway and Dowden were "better able to grapple with difficult realities in [their] pedagogical practices" and enhance "the student learning experience" through sharing "with trusted colleagues" (p. 207).

Moving forward through self-study

Self-study of teacher education practices is an approach to improvement of practice that simultaneously studies practices in the teacher education classroom and the teacher educators role in them. Self-study, which is initiated by practitioners in order to better understand themselves and their practice, is improvement-aimed, interactive, uses multiple qualitative methods, and validated through exemplars. S-STEP typically adopts an ontological stance that places experience above theory as practitioners puzzle over practice in context, often with the support of critical friends and collaborators. As conveyed by the four exemplars above, self-studies improve teacher education by deepening theoretical understanding, offering hybrid methodologies for studying practice, critically and reflectively storying the experiences of teacher educators, and/or closely examining the enactment of pedagogies and practices.

Moving forward, what more can self-study do to improve teacher education and contribute to enhanced practice in other contexts?

The work of the self-study community has validated and enriched the individual and collective work of teacher educators. Zeichner (2007) credited S-STEP for adding “dignity to the important yet universally undervalued work of those faculty and staff who educate a nation’s teachers” and contributing to “many improvements in the quality of teacher education programs” (p. 37). Yet Zeichner and others have challenged S-STEP to offer more generalizable and verifiable findings that can be replicated and implemented on a large scale to improve practice overall. Zeichner and Conklin (2005) made a case for research that helps identify program structures that are particularly effective in preparing teachers, especially in the face of politically-driven challenges to conventional programs. Similarly, from within the S-STEP community, Korthagen and Lunenburg (2004) suggested that self-study needs to build from improving one’s own practice to helping improve teacher education within one’s institution, and to offering collective gains within a wider community of teacher educators. Clift (2004), drawing on exemplars of program-level self-studies, made a strong case for self-studies that go beyond course-based inquiry to improving key program elements and “continuous self-study with an entire program” (p. 1360). Kitchen (2020b), in the second *International Handbook of Self-Study of Teaching and Teacher Education Practices*, argued for more self-studies of exemplary teacher education programs that feature shared vision, faculty members committed to the shared vision, academic rigor, and integrated approaches to learning across all university and field-based elements of the program. From them teacher educators can learn how to do multiple things well simultaneously, not just attending to one element at a time as can happen in individual self-studies. Petrarca and van Nuland (2020), in the same volume, make a strong case for more self-studies on the complexities of practice teaching and finding ways to make meaningful connections across program elements. Similarly, O’Connor et al. (2020) make a case for more self-studies employing teaching portfolios as integrative assessment tools to be used across courses. Also, it is important to consider teacher education leadership through a self-study lens. Allison and Ramirez (2020) propose that self-studies of leadership can “promote positive change within teacher education, the academy, and beyond to the work of teachers and schools in society” (p. 1220). Taken together, these handbook chapters offer constructive suggestions for programs of research within the S-STEP community.

It is also important to “look beyond teacher education to possibilities for self-study in schools and higher education” as “self-study has much to offer teachers, college and university instructors, and other professions” (Kitchen, 2020c, p. 1025). While self-study has always been concerned with teaching, there has been little growth in published self-studies by elementary and secondary educators. Whitehead et al. (2020), advocate for self-study as an approach to inquiry in schools by experienced school-based educators. Similarly, Samaras and Pithouse-Morgan (2020) have worked to extend the reach of self-study into higher education and beyond. They argue that transdisciplinary self-study “offers a broader inclusiveness to practitioners from multiple fields of professional expertise and from diverse disciplinary backgrounds” (p. 1294). Hopefully, the self-study community can reach out more to practitioners in schools, institutions of higher education and professions, who could benefit from self-study’s theoretical frames, methodologies and exemplars of practitioners researching themselves and their practices. Although self-study is still largely an English-speaking world phenomenon, there is considerable room for self-studies in other languages, from different cultural perspectives and from around the world (Thomas and Guðjónsdóttir, 2020). Interest across cultures and languages is evident in a volume of seminal self-study translated into Spanish (Russell et al., 2016) and an entire section of the second *International Handbook of Self-Study of Teaching and Teacher Education Practices* devoted to self-study across languages and cultures (Kitchen et al., 2020).

In conclusion, the self-study of teacher education practices has come a long way from its inception in the early 1990s and since the publication of the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* in 2004. The ongoing work of S-STEP as a community of practice and scholarship dedicated to studying and improving teacher education practices is worthy of acknowledgment. Its development as a methodology and its considerable body of published work merits celebration. At the same time, we need to take stock of the ways in which we as a self-study community can work toward improving education practice and programs at all levels—teaching, teacher education, community-based, and higher education.

In recent decades, the body of research on how to prepare teachers has continued to deepen, expand, and evolve, particularly in relation to approaches that can support teachers to enact humanizing, culturally sustaining, justice-oriented pedagogy (cf., [Carter Andrews, 2021](#); [Paris, 2012](#)). Yet while this body of literature on the preparation of teachers has proliferated, an essential companion to this research literature has remained persistently understudied: how do we prepare the people who prepare teachers? That is, how do we prepare teacher educators? And in particular, given persistent societal injustices, structural inequities, and systemic racism, how do we prepare teacher educators who will pursue transformative justice in the education of teachers ([Souto-Manning and Stillman, 2020](#))? In this article, I consider some of the research that sheds light on these questions. I begin by offering a personal illustration as a way of setting the stage for the scholarship in this domain.

Becoming a teacher educator: a personal account

When I reflect on my own journey of learning to become a teacher educator, a variety of sites, sources, and emphases stand out as contributing to my learning along the way. The first moment that I recognized I was becoming a teacher educator began more than 20 years ago during my time as a classroom teacher: a new colleague joined my team of seventh grade social studies teachers, and I began sharing my nascent social studies teaching practices with her in an effort to support her developing practice. That early professional experience of beginning to articulate my work as a teacher in order to foster my colleague's learning marked an initial stage of my journey as an educator of educators. Further, the experience inspired me to pursue doctoral studies at a university—focused on teacher education—where I rapidly expanded my opportunities to learn and grow as a teacher educator.

As part of my doctoral program, I enrolled in doctoral courses that helped me understand the history and politics of teacher education, practices of field-based teacher education supervisors, and approaches to action research in teacher education. As I pursued this coursework, I took part in a scholarly analysis of research about teacher education programs and practices under the guidance of an experienced and deeply knowledgeable mentor ([Zeichner and Conklin, 2005](#)). Alongside these experiences, I also practiced as a teacher educator, supervising teaching candidates as they learned to teach in a local middle school and leading a site-based weekly seminar for teaching candidates with a local teacher. At the same time, as a doctoral student, I conducted my own reflective action research on my emerging teacher education practice, collecting and analyzing artifacts of my practice as a way to deepen my learning and development as a field supervisor.

That intensive learning period launched me into the university-based work I do now as a teacher educator, teaching novice social studies teachers to develop their craft. Over more than 15 years in this role as a faculty member, I have continued my learning in various ways: through reading research on various aspects of teacher education, writing about dilemmas I have encountered and visions of practice I espouse ([Conklin, 2008](#)), participating in professional conferences, deliberately reflecting on my ever-evolving practice, partnering with a colleague and intentionally studying our own teacher education practices ([Conklin and Hughes, 2016](#)), and teaching a formal course to novice teacher educators ([Conklin, 2015, 2020](#)). Through all of these experiences, my work has been rooted in an overarching aim of creating more equitable, just, and humane learning spaces for young people in schools—a vision that has continually evolved, deepened, and clarified over time.

My intent in sharing the story of my own path is to highlight the many potential formal and informal contexts in which teacher educators may learn to do their work (cf., Murray, 2017), the varied forms of learning that may spur teacher educators' growth and development (cf., Hadar and Brody, 2017; Pinnegar and Hamilton, 2017), and the aims around which their learning may be centered. Yet while my personal story showcases many ways in which teacher educators might be prepared for and continually learn about their practice, it is also a very unusual story. A nagging theme in the research literature is that most teacher educators have very little preparation to help them learn how to become skilled teacher educators and very few intentional opportunities to further develop their practice (Goodwin and Kosnik, 2013; Goodwin et al., 2014; Ping et al., 2018; Stillman and Beltrano, 2019; Zeichner, 2005). And while there is limited research focused on the preparation of teacher educators in general, even less research exists that contributes to our understanding of how to prepare teacher educators who will challenge educational inequities, foster asset-oriented teaching practices, and disrupt the status quo (Stillman et al., 2019; Stillman and Beltrano, 2019).

In this chapter, I consider the anchoring question: How should we prepare novice teacher educators to foster critical, justice-oriented practice among teachers? I begin by offering an overview of research that has explored the learning and development of teacher educators. With this broader research landscape as a backdrop, I then draw from my own research to illustrate one approach to preparing novice teacher educators that highlights a subset of the dimensions of the learning and development of novice teacher educators. Specifically, I consider the affordances of a formal course of study in a university setting for novice teacher educators that focuses on pedagogical practices for critical, justice-oriented goals.

Existing forms of learning and development for teacher educators

While a wide range of people find themselves in the position of being teacher educators, very few have specific preparation for the role. Instead, research has confirmed that most teacher educators learn about the complex work of doing teacher education on the job (cf., Goodwin et al., 2014; Ping et al., 2018). Because many teacher educators have been classroom teachers at the primary or secondary level, there is often an assumption that the knowledge and skills they have acquired from being a classroom teacher will readily translate into becoming proficient teacher educators (Goodwin et al., 2014; Korthagen et al., 2005; Zeichner, 2005). Yet the existing scholarship on teacher educator learning and development offers a compelling case that the work of teaching children and teaching teachers—while similar in some ways—has important differences (cf., Bullock and Christou, 2009; Zeichner, 2005). For example, it's important for teacher educators to view teachers, themselves, as learners (Conklin, 2020; Stillman and Beltramo, 2019), and teacher educators also need to interrogate their own personal biographies and beliefs about issues like culture, race, class, and language in order to facilitate such learning among teachers (Cochran-Smith et al., 2020). Without opportunities for intentional training, most novice teacher educators are, at best, under-prepared for their roles—and at worst, they are in positions to reinforce problematic patterns of discrimination and inequity (Cochran-Smith et al., 2020).

Self-study and collaborative inquiry

While a lack of formal preparation for teacher educators is the norm, some teacher educators take it upon themselves to gain a better understanding of the important work they do. Thus, the primary way that teacher educator learning and development has occurred has been through self-initiated, individual or collaborative study of practice (Cochran-Smith et al., 2020; Hadar and Brody, 2017). Such examination of teacher educator practice has substantially increased in the last two decades and has led to a strong—though still small relative to the vast numbers of teacher educators—international community of teacher educators invested in their own and others' learning and development. The journal *Studying Teacher Education*, for example, was launched in 2005 to create a scholarly forum for sharing work focused on topics including self-study of teacher education practices, the transition from teacher to teacher educator, and the professional learning and development of teacher educators. This journal is a publication of the American Educational Research Association's Special Interest Group "Self-Study of Teacher Education Practice" (S-STEP), a community of educators dedicated to making contributions and improvements to theory and practice of teacher education. Scholarly communities like these have played a critical role in bringing attention to and advancing the learning and development of teacher educators.

Research in this area reveals that many teacher educators have fostered their own learning about teacher educating by closely examining and reflecting upon their practice as teacher educators (cf., Berry, 2009; Ritter, 2010). This robust body of work has shed light on how the practice of self-study offers an important pathway for teacher educators to surface their tacit understandings of teaching so that they can make those assumptions more explicit as they work with novice teachers (cf., Berry, 2009; Bullock, 2009; Loughran, 2007; Ritter, 2010). At the same time, self-study may also reveal the limits of one's knowledge as a teacher educator and highlight the complexity, challenge, and uncertainty of the work (e.g., Ritter, 2007). Further, such "self-education" may not result in the desired shifts in teachers' learning that teacher educators aim for, particularly with regard to issues of equity and justice (Cochran-Smith et al., 2020; Cochran-Smith and Villegas, 2016).

A closely related approach to the work of self-study is teacher educator development that occurs through collaboration among teacher educators. This research literature has demonstrated the value in collaborative inquiry into practice for teacher educators' development. Research has showcased teacher educators' learning through the formation of teacher educator inquiry groups (cf., Cochran-Smith, 2003; Hadar and Brody, 2013; Jacobs et al., 2015; Koster et al., 2008), faculty learning communities (Dover et al., 2020), collaboration with a critical friend or fellow teacher educator (cf., Conklin and Hughes, 2016; Peercy and Troyan, 2017; Vogel and Bartlett, 2013; Wolkenhauer and Hooser, 2021), or through participation in distinctive forms of inquiry like

Freirean culture circles and Boalian theater (Stillman and Beltramo, 2019; Stillman et al., 2019). Not only can these mutually vulnerable spaces foster important learning, this body of scholarship on collaborative inquiry has demonstrated the power of teacher educators' collective examination of problems of practice: when colleagues conduct this work together, they may be empowered to enact changes in the local contexts in which they work (Jacobs et al., 2015; Stillman et al., 2019).

Taken together, the learning that these different forms of inquiry into teacher educators' practice can generate is powerful. And importantly, the work in this domain represents teacher educators at many stages of professional learning: in some cases, it is novice teacher educators who take up such study (e.g., Ritter, 2007; Wolkenhauer and Hooser, 2021), while at other times, it is already experienced teacher educators who seek to continually improve their craft (e.g., Koster et al., 2008). While this body of work and the practices it showcases are vital to the field, such learning opportunities are not available to—or taken up by—all teacher educators: typically, this inquiry happens informally and is motivated by those teacher educators who take the work upon themselves or seek out like-minded colleagues for collaboration.

Formal study

Although some researchers have made compelling arguments that the primary content of teacher educators' learning and practice should focus on community-based knowledge derived from the local context (Stillman et al., 2019; Stillman and Beltramo, 2019), other scholars have argued that learning to become teacher educators should include not only inquiry into one's own practice in a particular setting but also formal preparation through coursework or other organized systems (Goodwin et al., 2014; Karagiorgi and Nicolaidou, 2013; Zeichner, 2005). And indeed, there is evidence of the need for the need for formal preparation for teacher educators. For example, Goodwin et al.'s (2014) research surfaced the finding that teacher educators had little preparation for enacting particular teacher education pedagogies, supporting the need for preparation in both the research on instructional strategies as well as intentional mentoring and support focused on pedagogies of teacher education (Goodwin et al., 2014; Lunenberg, 2002; Zeichner, 2005).

In various countries around the world, there have been some efforts to provide systematic education for teacher educators, such as in Israel, through the MOFET Institute (Cochran-Smith et al., 2020; Hadar and Brody, 2017), as well as in the Netherlands (Koster et al., 2008). In the United States, some doctoral programs focus specifically on teacher education (like the one in which I enrolled), while in Norway, teacher educators are encouraged to pursue doctorates, although the emphasis of these degrees is primarily on research (Cochran-Smith et al., 2020). Yet most researchers who study the education of teacher educators agree that none of these existing systems is sufficient; the existing programs either reach a very limited number of teacher educators or do not include the full range of professional learning that is necessary to become thoughtful, skilled, and justice-oriented teacher educators (Cochran-Smith et al., 2020).

Advocates of more formalized teacher educator learning and preparation have suggested specific types of understandings that teacher educators should hold for their work. These include knowledge about teacher education policy debates, the history of teacher education, research on teacher mentoring and teacher education pedagogies, as well as training and experience in particular pedagogies of teacher education (Cochran-Smith et al., 2020; Goodwin et al., 2014; Lunenberg, 2002; Zeichner, 2005). Further, scholars have suggested that preparing teacher educators should involve helping them gain in-depth understandings of human learning and development situated in complex socio-cultural contexts; expertise in diversity, cultural relevance, and social justice; contextual, socio-political, and sociological knowledge; and research capacity rooted in an inquiry stance (Cochran-Smith et al., 2020; Goodwin and Kosnik, 2013). Such scholarship has also included the recommendation for teacher educators to have ongoing opportunities to examine their own assumptions and biases related to issues like inequality, culture, race, sexual orientation, and language and how such biases relate to policies and practices in schools (Cochran-Smith et al., 2020). Finally, some scholars have focused on the need for teacher educators to hold a specialized form of expertise that matches the complexity of teaching; such understandings would enable teacher educators to nurture novice teachers' thoughtful decision-making within a vision of teaching that emphasizes its complexity (Goodwin and Kosnik, 2013; Loughran and Menter, 2019).

Varying emphases of professional learning for teacher educators

The calls for particular formal areas of study in the preparation and development of teacher educators point to the many different emphases of the various forms of professional learning reported in the research literature. Some scholarship, for example, has highlighted the process of becoming teacher educators in particular content areas, such as learning to become mathematics teacher educators (cf., Yow et al., 2016) or developing the pedagogical content knowledge needed to be successful science teacher educators (cf., Abell et al., 2009). In other cases, researchers have focused on learning to use particular pedagogical approaches as teacher educators, such as documenting the complexity of learning to use core practices in the context of preparing novice teachers of English Language Learners (Peercy and Troyan, 2017).

Other scholars have turned their attention to the broader aims of the enterprise of preparing teacher educators. In particular, a variety of scholarship in more recent years has taken up the question of how to prepare teacher educators who will work toward justice and transformative goals—an essential emphasis, given the vast, systemic inequities in our current schools. Stillman and Beltramo (2019), for example, documented how their group of teacher educators used Freirean culture circles and Boalian theater over 3 years to foster deeper understandings of the critical, contingent nature of asset-oriented teacher education and the necessity of focusing on relationships and community contexts in order to disrupt the inequitable status quo. Dover et al. (2020) used their

critical, social justice-oriented faculty learning community to support their efforts as teacher educators to teach for social justice. As [Carter Andrews \(2021\)](#) argued, this kind of focus on the development of teacher educators' sociopolitical consciousness is essential for enacting humanizing, justice-oriented teacher education pedagogies.

Thus, in considering the research base on the preparation of novice teacher educators for critical, justice-oriented aims, there are limited but emerging insights. I turn now to offer one case from my own research and practice that demonstrates the role a formal course of study can play in fostering learning among novice teacher educators. Given the particular needs established for teacher educators to learn to enact pedagogies of teacher education ([Goodwin et al., 2014](#)) that enable them to pursue transformative justice ([Souto-Manning and Stillman, 2020](#)), this case highlights a structured set of learning experiences designed to emphasize the pedagogy of teacher education anchored by critical, justice-oriented goals.

A case of formal preparation for novice teacher educators focused on critical, justice-oriented aims

Course background and focus

The research I describe here focuses on a course I taught in 2009 to university doctoral students who were learning to become teacher educators ([Conklin, 2015](#)), what the doctoral students learned from the course, and how this learning shaped their teacher education practice over time ([Conklin, 2020](#)). The course I designed—titled “The Pedagogy of Teacher Education”—sought to help novice teacher educators learn about *how* to teach novice teachers. The pedagogy of teacher education refers to the range of instructional strategies, tasks, assignments, and interactions that teacher educators use in teacher education contexts ([Grossman, 2005](#)), such as using cases for teachers to explore the dilemmas and complexities of practice (e.g., [Darling-Hammond and Hammerness, 2002](#)), modeling practices (e.g., [Loughran and Berry, 2005](#)), or engaging teachers in action research (e.g., [Price and Valli, 2005](#)). In this course, my particular aim was to enable novice teacher educators to gain both theoretical and practical knowledge—conceptual and practical tools ([Grossman et al., 1999](#))—of teacher education pedagogy, rooted in a vision of compassionate, critical, justice-oriented teacher education ([Conklin, 2008](#)).

The 15-week course, which I taught to ten novice teacher educators pursuing doctoral degrees in education at a US university, began by engaging students in exploring conceptual frameworks of teacher learning and scholarship focused on teacher education pedagogy. The course then went on to examine scholarship that emphasized the purposes of justice-oriented teacher education, focusing on approaches that both embrace diversity and critically examine structural inequities (e.g., [Banks et al., 2005](#); [Gay, 2002](#); [McDonald and Zeichner, 2009](#); [Sleeter, 2008](#); [Villegas and Lucas, 2002](#)). Another conceptual thread that ran through the course was the importance of relationships and compassion as elements of the pedagogy of justice-oriented teacher education ([Conklin, 2008](#); [Hanh, 1987](#); [hooks, 2003](#)). These theoretical emphases were complemented by regular class experiences that served as conceptual tools, such as collective discussion of teacher education tasks and assignments in which we used a common set of analytical questions about the goals of the assignment, its key features, and conceptions of learning embedded within it. All of these conceptual frameworks were intended to support the novice teacher educators in better grasping the aims of justice-oriented teacher education and providing them with theoretical guides for their future teacher education practice.

Throughout the course, I paired these conceptual tools with practical tools to help the novice teacher educators envision and experience pedagogies of teacher education in tangible ways. While course readings featured scholarship on specific teacher education pedagogies, we also participated in these pedagogies during class sessions whenever possible. For example, we paired reading about the use of cases in teacher education (e.g., [Darling-Hammond and Hammerness, 2002](#); [Goodwin, 2002](#); [Moje and Wade, 1997](#)) with a class analysis of a teacher education case dilemma I had encountered in my teacher education practice: how to address a white pre-service teacher who enacted racist caricatures in class. Similarly, we read scholarship on pedagogies such as the use of role playing/theater of the oppressed ([Cahnmann-Taylor et al., 2009](#)) and conducting critical readings of texts ([Jones, 2006](#))—practical pedagogical tools aimed at preparing critical, justice-oriented teachers. We also participated in other pedagogies as part of our course sessions, such as using a structured, equity-oriented discussion protocol called the “Final Word” that equalizes participants' opportunities to share ideas and counters traditional patterns of classroom dominance ([Fischer-Mueller and Thomson-Grove, n.d.](#)). All of these practical tools were aimed at offering the novice teacher educators concrete pedagogies that they could enact with novice teachers that were aligned with the course's conceptual underpinnings.

As our collective participation in these practices suggests, a key pedagogy of the course was the modeling of practice ([Loughran and Berry, 2005](#)) and making key features of practice explicit ([Loughran and Berry, 2005](#); [Lunenberg et al., 2007](#))—an approach to fostering teacher learning supported by research. Thus, I engaged novice teacher educators in specific pedagogies in our classroom as a way of demonstrating possible practices they could use as teacher educators; this modeling of practice was also intended to illustrate to the novice teacher educators that they, too, could and should model specific pedagogies as part of their work preparing future teachers. Further, following each demonstration of a teacher education pedagogy, I also modeled the analysis and evaluation of the practices we had used from a pedagogical perspective in order to make its features explicit ([Loughran and Berry, 2005](#)). In some cases, I used this opportunity to reflect aloud and offer critiques of my own practice. Again, this analytical practice of debriefing was aimed at showing novice teacher educators how they could make their own pedagogical choices transparent to novice teachers.

Studying novice teacher educators' learning and practice

Five years after teaching this course, I set out to examine what the novice teacher educators had learned from our formal study of the pedagogy of teacher education and how, if at all, the coursework shaped their own practice as teacher educators. Of the ten students who had enrolled in the course, four were in roles as practicing teacher educators and agreed to be part of the research. Each novice teacher educator completed an initial survey that asked about their current role and the courses they taught. The survey also invited them to reflect on influences on their teacher educator work, provide examples of teacher education practices they were currently using that they deemed successful and unsuccessful, and consider what role—if any—the doctoral coursework had in shaping their practice as teacher educators. Following their survey completion, I interviewed each participant, asking them to discuss influences on their teacher education practice further, talk about the goals of their work, and share sample assignments and syllabi from their practice as teacher educators. The participants provided me with sample assignments they had completed in our course as a way of documenting changes in their learning over time. While only possible in the case of one participant, I also observed a class session of the participant teaching pre-service teachers as one further source of data to trace any relationship between the formal course learning and the novice teacher educators' learning and practice.

Although this exploratory case study only included a small group of participants, the results provided a window into both the potential of formal coursework for teacher educators' learning and valuable practices for the development of justice-oriented teacher educators. While each novice teacher educator's learning was shaped by their own identities, experiences, prior learning, and the contexts in which they worked, the data illuminated both conceptual and practical tools from the coursework that influenced the novice teacher educators' learning and practice (Conklin, 2020).

Learning conceptual and practical tools

First, the research with these participants demonstrated that they learned a range of conceptual tools from the Pedagogy of Teacher Education course that offered helpful guidance in their work as teacher educators. The course's range of teacher learning theories and conceptions of the various purposes for teacher education provided novice teacher educators with theoretical frameworks that enabled them to make intentional choices as teacher educators; these conceptual tools also offered the novice teacher educators a clear language and rationale that helped them provide reasoning for the practices they implemented and justify both pedagogical and programmatic decisions. The theories of teacher learning featured in the course also helped the novice teacher educators to view teachers as learners, something they had not all considered before. Further, the value of modeling as part of teacher education practice was also salient for the novice teacher educators; they came to understand the importance of being intentional as a teacher educator and making these intentions transparent in their work with novice teachers. Finally, the coursework's conceptual underpinnings of compassionate, critical, justice-oriented teacher education showed up in various aspects of the novice teacher educators' learning and practice, shaping their interactions and pedagogies with novice teachers, the purposes of the teacher education experiences they designed, and their teacher education course planning (Conklin, 2020).

Second, this exploratory study of novice teacher educators' learning from the formal coursework revealed practical tools, too, that contributed to the teacher educators' development. In many cases, the participants reported directly using particular strategies or assignments that they learned in our coursework in their work with novice teachers. They also noted that they used the practice of modeling, debriefing practices, and making pedagogical decisions explicit, following the use of these practices in our coursework. Thus, the research highlighted the value of offering—and modeling—specific teacher education pedagogies for novice teacher educators. These specific pedagogies served not as a prescribed set of practices for teacher educators but instead gave novice teacher educators an array of concrete possibilities for how they might facilitate the learning of novice teachers (Conklin, 2020).

Unplanned course learning

This exploratory case study also revealed that the novice teacher educators gained additional learning from the course that had not been a planned, intentional focus. Specifically, these novice teacher educators reported finding value in the ways that I, as an instructor, demonstrated a willingness to take pedagogical risks, show vulnerability, and be explicit about times I thought my instruction had not succeeded. The study participants noted that, particularly as novice teacher educators who were nervous about their developing craft, it was powerful for them to see another teacher educator be open about the unpredictability of teacher education practice and the insecurities that come along with our work. Additionally, the novice teacher educators in the study noted that the course helped them understand the incredible complexity of the work of teacher education—something which I also see as a fundamental quality of educating teachers, but a quality I had not made an intentional goal for the course learning.

Implications of this case

The case of this formal coursework focused on the pedagogy of teacher education demonstrates one avenue for supporting the learning of novice teacher educators and helping those who are new to the craft develop and enact pedagogies for teacher education focused on justice-oriented goals. Specifically, the study indicated that the intentionally designed course experiences enabled novice teacher educators to learn both conceptual and practical tools for teacher education pedagogy. These tools included the recognition of teachers as learners; critical, justice-oriented theories of teaching and teacher education; and pedagogical tools that support those justice-oriented goals. Further, in the face of increasingly reductive, technical approaches to teaching that have gained traction globally (e.g., Lemov, 2010), this formal coursework provided one approach to helping novice teacher educators understand the

complexity of teacher education practice, resist simplistic models of practice, and learn tools to transform teacher education (Loughran and Menter, 2019).

Looking more broadly, this example points to a variety of implications for the preparation of justice-oriented teacher educators. Providing novice teacher educators with both conceptual and practical tools that are connected to critical, justice-oriented goals offers a crucial pairing; as others have argued, in order to reform teacher education, it is essential for the field to have not only clear conceptualizations of socially-just, transformative goals, but also corresponding teacher education practices that support these goals (Cochran-Smith et al., 2009). Indeed, many scholars have made the critical point that teacher educators need concrete, practical approaches that are clearly connected to theoretical constructs that allow for decision-making in complex and changing contexts (Cochran-Smith et al., 2020; Goodwin and Kosnik, 2013; Peercy and Troyan, 2017). The research case I describe also adds to other scholarship that indicates the potentially important role of modeling vulnerability and risk-taking as key pedagogies in the preparation of justice-oriented teacher educators (cf., Berry and Russell, 2016; Dale and Frye, 2009; hooks, 2003; Peercy and Troyan, 2017)—pedagogies that should likely go along with modeling flexibility, openness, a commitment to continual learning, and humility (Cochran-Smith et al., 2020). Additionally, this research supports the idea that formally organized coursework can play an important role in teacher educators' development, alongside more contextually-driven study into one's own practice (Goodwin et al., 2014; Zeichner, 2005).

Conclusion

With this case of research and practice in mind, then, along with the broader research on teacher educators' learning and development, how should we prepare novice teacher educators to foster critical, justice-oriented practice among teachers? In part, this body of work suggests that advancing the aims of critical, justice-oriented teacher education will require a multitude of coordinated approaches for preparing and developing teacher educators. Such approaches should equip teacher educators with clear conceptual frameworks to guide their practice along with practical approaches that are well-aligned with these theoretical underpinnings and that highlight the complex, contextual, socio-political, and relational nature of transformative teacher education (Cochran-Smith et al., 2020; Stillman and Beltrano, 2019).

The existing research also suggests that the preparation and development of teacher educators must be planned intentionally and prioritized, particularly to support critical, justice-oriented goals. Providing more just and equitable learning experiences for all K-12 students relies on well-prepared teachers with strong sociopolitical consciousnesses—which, in turn, relies on well-prepared teacher educators. While the research literature illustrates that there are important efforts underway in contexts around the globe to support novice teacher educators' learning, such efforts remain small and scattered relative to the vast need that exists. Prioritizing the professional learning of teacher educators in order to support the work of asset-oriented, culturally sustaining teaching is an urgent need.

Introduction

Faculty members in higher education are required to excel in teaching, undertake scholarship activities, present research excellence, and work intensively to become experts in their profession. Academic promotion is measured by achievements reached by faculty as lecturers, as researchers contributing to the body of knowledge, and as contributors to varied services' activities (Brew, 2010; Halse et al., 2007; Shagrir, 2015a).

As faculty members in higher education, teacher educators are required to act at all times as professionals researching their work, their teaching, their professional pathways, theirs' and their students' achievements, and the body of knowledge they teach. Researchers emphasize focusing on conducting research and investigating teaching as activities that should be part of the professional daily routine of those who prepare students to be professionals in the teaching profession (Griffiths et al., 2014; Hökkä et al., 2012; Murray, 2010).

Researchers have found that teacher educators for whom undertaking research is the norm and resolute and long-term occupation with activities of a research nature optimize their functioning in teaching and working with students (Russell, 2010; Tack and Vanderlinde, 2016), and they serve as good role models for students who will be, in the future, teachers like them (Berry and Scheele, 2007; Loughran, 2014; Loughran and Berry, 2005; Shagrir, 2010a).

Teacher educators are called upon to enlist in this matter. The more they continue to research in their fields and areas, and the more they add important outputs, findings, and conclusions, so will opportunities for them to expand their scholarship achievements increase to expand the profession's body of knowledge and improve the status of teacher education as a profession among all other academic professions (Cochran-Smith, 2005; Lunenberg et al., 2014; Murray, 2010; Shagrir, 2011).

Teacher education is a profession in and of itself (Bridges, 1999; Shulman, 1998) and its features require those who are occupied in it to be qualified and master specific skills (Hadar and Brody, 2017; Koster et al., 2005; Loughran, 2006). Similar to academic programs educating students for professional occupations such as medicine, para-medical professions, social work and others, teacher education programs also aspire to instill in students mastery of the profession's secrets, existing educational doctrines, and theories, as well as mastery of the practical skills of teaching and learning serving those occupied in the teaching profession. However, teacher education programs have a unique nature, and components that are not included in academic education programs for other professions; therefore, teacher educators who lead them require unique qualifications. These unique qualifications are essential by virtue of teacher educators serving in their teaching and professional conduct as role models for students and by virtue of they being examples encouraging future teachers to act as teacher-researchers as well (Berry and Scheele, 2007; Lunenberg et al., 2007; Shagrir, 2010b).

Since the teaching profession is in essence a practical profession, teacher educators are required to demonstrate expertise both in constructing and leading quality programs and courses, and in building an envelope including everything that must be experienced in teaching practice that allows students to progress toward being quality teachers (Korthagen, 2014; Korthagen et al., 2005; Swennen et al., 2008). Likewise, teacher educators must ensure that students acquire knowledge in subject areas taught in schools, acquire the qualifications, tools, and skills necessary for their work and quality teaching, learn how to apply the knowledge, theories and professional doctrines in education and pedagogy, get to know the educational field in which they will have to operate and more (Shagrir, 2013a).

Loughran (2014) added that over and above teaching skills and working with students, teacher educators must possess abilities to carry out researching teacher practices, skills and means of attaining them can be acquired through professional development

activities. Therefore, educational systems, institutions, unions and professional bodies are called upon to continue to encourage involvement, learning and scholarship activities among teacher educators. They are called upon to mark out cornerstones and develop a variety of means that lead to offering interesting and fruitful professional and scholarship activities (Griffiths et al., 2014; Shagrir, 2017c).

Professional growth

Faculty members interested in being experts in their profession, and who want to advance in their academic career, must meet promotion requirements published by each academic institution. Although promotion requirements differ between institutions, most require faculty members to invest in activities leading to professional development and do this continuously to achieve full mastery of skills, content, and unique features of the profession (Avalos, 2011; Boyd et al., 2007; Murray, 2010). Guidelines call on faculty members to participate in professional development activities, in other words, to be consumers using up to date knowledge emerging from studies conducted by others, and also to initiate conducting long and short-term professional and quality research (Loughran, 2014; Shagrir, 2017c).

Participation in professional and scholarship activities is seen as contributing to teacher educators building their professional identity as teacher education professionals (Dinkelman, 2011; Griffiths et al., 2014; Hökkä et al., 2012), and is perceived to influence ways of teaching, and thus also students' learning achievements. Long-term professional development is likely to lead to expertize in levels of teaching performance, which will result in students' meaningful learning (Jarvis et al., 2013; Shagrir, 2015b).

Enlisting in the scholarly growth journey, is viewed as contributing to improving and enhancing teacher educators' work and professionalism on several dimensions (Shagrir, 2010a). One dimension is structuring the professional self. This is affected by the professional nature and level of activities carried out, and the effect of consolidating conceptual role perceptions in relation to the educational world, the world of teacher education, the role of teacher education, and the professional theories and doctrines on which it is founded. Another dimension is expanding professional relationships established over time and increasing the intensity of these relationships. This dimension is expressed in the nature of collaboration with partners such as, students, professional colleagues and professional community members, and the nature of cooperation with educational institutions, education systems and professional bodies and unions (Berry and Scheele, 2007). Participation in scholarship activities deepens another dimension, the personal dimension expressed in the degree, scope, power, and willingness of individuals to commit and dedicate themselves to scholarly growth and their professional development (Shagrir, 2010a).

Researchers emphasize that teacher educators should constantly engage in their own professional development and in research as long as they serve as teacher educators. They should publish the professional knowledge they possess, reveal, and clarify their insights, and be aware of the impact of their work on students (Boyd et al., 2007; Hökkä et al., 2012; Koster et al., 2008; Lunenberg and Hamilton, 2008; Lunenberg, 2010; Shagrir, 2013b, 2015a).

In conclusion, teacher educators should meticulously investigate their work, and constantly develop new directions of improving it. All these will contribute to their progress toward expertize, meeting promotion requirements, academic promotion and career advancement, will promote their and their institution's national and international reputation, and in general contribute to improving the quality of teacher education and affect education systems in which they operate (Berry, 2009; Hadar and Brody, 2017; Lunenberg and Hamilton, 2008).

Three-stage model of scholarly growth in teacher education - ISE

The three stage Model of Scholarly Growth in Teacher Education - ISE, follows processes occurring during faculty members' development journey and was built after accumulating decades' experience working in teacher education. The model is based on a profound, reflexive analysis (Attia and Edge, 2017; Berger, 2015; Brand, 2015; Palaganas et al., 2017) of the author's professional development steps, and an analysis of what teacher educators from diverse institutions and countries have stated in research studies including dozens of conversations and interviews. Research findings reflected development and professionalization processes among colleagues helped to build the foundation of the ISE Model.

The published model (Shagrir, 2020) consists of three stages: the first is the stage of induction into teaching in higher education and formulating worldviews and ways of working as members of the profession. The second stage expands the range, intensity and depth of professional development and scholarship activities undertaken to acquire expertize and academic promotion. The third stage presents the role and contribution of those who have reached achievements and are considered experts in the profession in which they are occupied, experts in the area of knowledge they research and teach, and highly experienced researchers.

Details and more depth in describing the features of each of the three stages in the ISE Model establish its important meaningfulness as a tool for scholarly growth, and a professional tool helping faculty members to get to know the spectrum of opportunities available to them in an academic career. The model includes signposts, serves to direct growth, and teaches about challenges and milestones facing those who want to grow and reach desired academic promotion.

The ISE Model is presented as a linear-processive model. This mean of presentation allows expanding and adding explanations clarifying the place and importance of each stage. Each stage in the model derives from, relies on and grounds its previous stage. Every stage presents the unique features and categories added to faculty growth and its involvement in research activities. The model

describes how progress is created in research work, and the effects of professional growth on shaping professional views, shaping professional identity, and establishing research skills. The model's description provides details about tools and skills researchers require at different stages and includes options available to them to deepen and navigate their research work, and to focus on collaborative research with students, colleague, experts from similar and different areas of interest.

The description here expands on what has been presented in the past (Shagrir, 2020) mainly for the purpose of examining scholarship and research activities, which are considered a central component of growth in professional functioning for teacher educators who are also researchers.

The basic stage of the ISE Model – building professional identity as a researcher - I

Candidates for the role of teacher educators in most higher education institutions must have a higher academic degree. For most, induction into the role does not require designated previous education including knowing the role's demands and accompanying challenges (Loughran, 2006; Murray and Male, 2005; Swennen et al., 2009). In some teacher education institutions, there are no acceptance conditions requiring candidates to have previous experience in teaching, for example teaching children at schools. Hence, research literature often addresses suggestions and advice for successful induction into the profession and raises the difficulties and challenges facing those deciding to join the role of teacher educators (Boyd et al., 2007; Swennen and van der Klink, 2009; van Velzen et al., 2010).

As previously mentioned, upon induction into the role, and throughout the years of work in higher education, faculty members should aspire to academic promotion, reach professional achievements, acquire academic and professional expertise in their teaching areas and the teacher education body of knowledge. Upon induction, teacher educators are busy building their professional identity including acquiring suitable teaching tools to teach teaching, building ways of working and tools to implement pedagogical considerations as role models for students, building working relationships with students, developing reflective skills and tools to integrate theory and practice, building organized and established doctrines as part of their professional credo, developing suitable values, formulating professional conceptions and the like (Dinkelman, 2011; Hökkä et al., 2012; McKeon and Harrison, 2010; Williams and Ritter, 2010). The entirety of these tasks and challenges facing early career teacher educators are included in the basic stage of the growth model, where they acquire and build their professional identity as members of the profession. This stage is called Identity and is symbolized in the model's name with the capital letter I.

The building professional identity stage also includes establishing a foundation for professional growth as early career researchers. One can see that in this I stage teacher educators acquire basic tools to serve them as researchers learning the secrets of the academic world which they have entered, and bodies of knowledge they teach (Beaudry and Miller, 2016).

The basic tools early career researchers employ include intelligent consumerism of studies published on academic stages such as journal articles, textbooks, lectures, presentations and so on. As intelligent consumers, they will utilize up to date research findings and conclusions and integrate them into various courses and programs they teach. At the I stage, faculty will develop skills of reading, listening, and observing academic publications presented in various formats, will acquire the language, concepts and terminologies of the research world and academic publications, and will constantly be updated about developments in the professional knowledge world in their taught subjects. On the basis of the knowledge and skills acquired, they will also update their students on professional innovations both in different teaching situations and syllabi.

In most cases researchers in their Identity stage have experienced in the past conducting several in-depth and broad ranging studies, mainly in writing their theses as part of the requirements for higher academic degrees. Thesis research leads to a significant change in the way researchers perceive themselves as researchers, how they perceive the need for time and resources to conduct research, and their awareness of everything needed for research to be reliable, valid and professional to meet the requirements of academic research.

In a few cases, there are faculty members who avoid undertaking any task related to research after completing their theses in academic frameworks. The intensity, energies and resources needed to carry out studies create among some people a fear of not being able to withstand again such tasks even if they are smaller in scope (Shagrir, 2017c).

Murray (2008) pointed out that not all teacher educators are meant to undertake research, but all of them must have insights about studies and materials published, must be involved and aware of innovations emerging from research, and persist in enquiries into personal practice.

Those who are interested in progressing as researchers invest efforts and time resources in a range of activities such as initiating and planning studies, conducting disciplinary and/or pedagogical research, acquiring the correct tools to submit applications for research grants, responding to calls for proposals to conduct studies, expanding collaborations with fellow researchers, promoting research in their knowledge areas, and the like.

Some of those interested in progressing along academic scales see research conducted in their theses as an inviting event with whose conclusion, and because of it, they can be part of the research world and are able to advance it and come out with additional research work. Such work includes, for example, investing in disseminating thesis research outputs on accepted academic stages and turning their accumulated knowledge into knowledge publicly available, and especially to their colleagues in the profession (Hadar and Brody, 2017; Murray, 2010). Another direction taken by researchers in their early professional careers is conducting studies based on their theses research results, such as follow-up or comparative studies. Furthermore, they conduct new research, sometimes using research methodologies known to them, and sometimes experiencing and acquiring tools to employ new research methodologies or explore areas they have not investigated before.

Institutions view scholarship and research activities as part of what is required of early career teacher educators, and failure to participate in such activities is likely to threaten their continued employment in an academic framework. Most academic institutions make available to staff infrastructure and platforms to encourage research activity, and even offer researchers assistance, learning, and support under research centers for faculty. Among others, professional support is offered by colleagues and experienced role holders, research budgets, calls to conduct research and more. Some proposals call to conduct studies within employing institutions. Such studies focus, for example, on investigating institutional worldviews, curricula, or vision, or on studying populations operating in an institution such as lecturers or students. Some proposals call to conduct studies about populations and topics outside an institution, such as systemic, social, educational, or disciplinary topics. Some proposals call to conduct studies in the framework of interinstitutional and/or international partnership (Brooks, 2005; Geerdink et al., 2016; Rosser and Johnsrud, 2003).

Such conduct in institutions encourages early career researchers to continue to study, to undertake diverse opportunities to conduct research, and thus to exploit them as opportunities contributing to developing and establishing their professional confidence as researchers and as professionals (Geerdink et al., 2016; Murray and Male, 2005; Shagrir, 2010a; Williams and Ritter, 2010).

Achievements during development at the basic I stage lead researchers to continued professional development and promotes their growth to the next, second stage in the Model of Scholarly Growth - ISE.

The intermediate stage of the ISE Model – conduct as a scholar in higher education – S

At the next stage of the Model of Scholarly Growth - ISE, faculty members focus on a broader scope of scholarship and research activities continuing from those carried out at the Identity stage. Together with performing constant research activities based on experience, knowledge and tools acquired at the previous stage, faculty also invest resources and time in expanding their professional conduct as professional scholars. This stage of professional growth is called Scholar and is therefore symbolized in the model's name by the capital letter S.

Researchers who have reached the S stage already have experience in organizing and leading studies, sometimes have even led teams of researchers, and have mastered research skills and met deadlines set for completing research. They apply the worldview consolidated and professional conceptions they had built at the previous stage as a foundation for their perception as researchers, and basis for their view of research's place and contribution. At this stage, researchers enhance their acquired abilities and their undertakings also make a relevant contribution to the world of content and that of teaching, and present informed recommendations with a broad impact and challenging ideas for those interested in future research. Researchers carrying out collaborative studies develop abilities to establish meaningful work relationships during research and ongoing cooperation. They develop abilities to resolve challenges arising from disagreements that sometimes occur between researchers, learn to contain others' ideas and how to clearly present their ideas (Koster et al., 2008; Murray et al., 2009; Shagrir, 2017a).

Expanding professional conduct and professional identity as scholars means operating in parallel in two dimensions that fit together and nourish each other: the one is conduct as professional scholars and the other - conduct as professional researchers. The latter dimension at the S stage means employing various research tools, expanding use of diverse research methodologies, choosing diverse research populations, enriching examined areas, choosing a range of research partners, conducting studies requiring long-term work such as in-depth studies, follow-up studies, comparative studies, and the like (Swennen et al., 2017; Tack and Vanderlinde, 2014).

Conduct as professional scholars is characterized by also addressing activities that interface with the world of research and mainly derive from it. Professional scholars labor to disseminate the fruit of their studies, invest efforts to make them known to the public, to persuade others that the fruits of their studies are important and meaningful, and track how much and to what extent these fruits indeed influence the body of knowledge in the scientific world (Denemark and Espinoza, 1974; Haviland et al., 2010; Rubin and Zadik, 2015). Faculty at stage S are meant to be experienced in clear and comprehensive presentation of their worldviews and professional visions to others and diverse institutions, bodies, and systems. Activities they perform as scholars will also leverage and promote their academic reputation and that of the academic institution where they work and research (Swennen et al., 2017).

To illustrate: mass presentation of research outputs while using specific skills such as writing publications for prestigious academic professional forums. Being keynote speakers at conferences and study days. Leading core agenda in social, academic, or professional areas, and more. Such platforms require scholars to invest time and learn how to do it and acquire specific skills and abilities that will enable them to meet their rigorous demands.

Another example of conduct as professional scholars is being concerned with activities leading to securing resources and grants to conduct research. The essence of these activities is mostly developing abilities to respond to calls for proposals from research foundations or invitations to conduct research for bodies, associations, institutions etc. These activities mostly have a systemic nature, whether institutional, national, or international and sometimes require collaboration with and including research colleagues from diverse institutions, associations, and organizations.

Further and many examples teach us that this layer of work as researchers requiring partnerships of such scope deepen and expand professional worldviews and enable researchers to study a range of research populations, and meet teacher education cultures different to that which is known. In this way researchers operate as part of the scientific community and work to promote their place and name in the community and contribute to the scientific world.

Successes and achievements in diverse and extensive activity performed by scholars at the S stage are the basis for transition to the third and advanced stage of the ISE Model of professional and academic scholarly growth.

The third stage of the ISE Model – conduct as an expert – E

The third stage of the Model of Scholarly Growth - ISE is the stage at which faculty function as both experts in knowledge areas they teach and research, and experts who have mastered the enigma of the academic research world. Hence the third stage of the model is called the Expert stage and is symbolized in the model's name by the capital letter E.

This stage is attained by researchers who possess a consolidated professional identity, professional confidence, rich teaching experience, broad and profound mastery of knowledge areas, qualifications, and skills, as detailed in the characteristics of the previous two model stages (Bradley et al., 2006; Kinchin et al., 2008).

At the E stage, faculty continue to function persistently and in great depth as researchers and at the same time invest resources in additional dimensions. They invest mainly in activities where expertise is demanded and their contribution as experts influencing the professionalism of education systems and higher education, as helping to build education systems' worldviews and policies, as partners in building policies, visions and work plans for influential and leading bodies. The nature of activities in stage E changes from those focusing mainly on achievements in one's personal professionalization and academic-profession progress, to activities with a nature of service and contribution to benefit the profession, the scientific world, and society. Through such activities experts influence the areas in which they have worked and specialized, and become those leading the scientific world, profession, and research in higher education (Shagrir, 2017b).

Below are some examples of scholarship activities of a nature that contributes to and influences others and the world of knowledge in which experts have specialized: writing and publishing position papers, opinions, and reviews in professional areas. Active leadership of academic conferences, interest groups, forums and think tanks. Active membership of journal and academic books' editorial boards. Taking part as members or managers of professional bodies and associations. Heading grant award committees and leading professional working bodies as known experts. Main undertakings are for the benefit of building, leading and implementing professional agenda and systemic policy in education systems, higher education systems and/or teacher education systems.

As mentioned, most these activities, which are only a few examples of possible undertakings, are not always considered part of the required obligations of those operating in the promotion process framework and personal promotion in academic institutions' professorial levels. Nonetheless, these activities certainly advance the body of knowledge in teacher education, the world of higher education and thus society too.

Research literature has taught us that some expert researchers saw their achievements as a good opportunity to conduct reflexive research on their scholarly growth (Loughran, 2014; Russell, 2018; Young and Erickson, 2011; Zeichner, 2005). Reflexive research enables an examination of the overall activities, experiences and achievements reached over years. It allows identification of the nature of contributions made to the academic world and body of knowledge and thus reach conclusions regarding the next steps of their scholarly growth. Using reflexive research methodologies, researchers examine and analyze their career progression, stations and junctions of their progress and growth, difficulties and challenges encountered, solutions they chose, and degree of expertise reached and its benefits. In light of findings emerging from reflexive analyses, experts can plan their continued professional journey and possibilities available to them in their academic-professional journey. They can decide in which areas and topics it is worthwhile investing resources and plan the pathways on which they will focus to continue to influence with the expertise they have accumulated over years.

Those who define themselves as professionals may conduct a reflexive examination of their professional paths at an earlier stage of their development and analyze their challenges and successes by revealing generic insights assisting them to explore directions for continued professional undertakings. Reflexive research carried out at the third stage of scholarly growth helps identify historical growth steps, examine them in comparison to professional colleagues, and through profound introspection produce broad and universal insights about the uniqueness of their journey and voice, insights that are likely, among others, to help colleagues at earlier stages of their growth (Brand, 2015; Day, 2012).

Concluding remarks

The three stage Model of Scholarly Growth - ISE presents the features of faculty members' conduct and activities at different stages of their academic career development, and their professionalization as professionals and experts. The way the model is built raises the highlights the benefits of scholarly growth when it occurs as processive growth, which consolidates over time through participation in diverse scholarship and research activities.

Answering three key questions will help teacher educators identify the contribution of the ISE Model and perhaps to adopt the directions it outlines:

Why is it important to get to know the ISE Model?

How should the ISE Model be used?

What is the contribution of the ISE Model to teacher educators?

Why is it important to get to know the ISE Model?

The ISE Model outlines numerous ways to professional growth including specialization in quality teaching, consolidating established professional conceptions and insights, mastering skills and required qualifications, and developing diverse professional

abilities. The model constitutes a tool to identify the development and growth stage in which individuals find themselves, present meaningful ways in which they can strive toward scholarly growth and progress to the next stages, and it constitutes a tool to understand challenges and benefits of the stage to which they strive to advance. Because ISE Model is built as a processive-linear development model, it demonstrates the nature of scholarly growth and how it expands in different working directions, using a range of platforms and work intensity at every growth stage. To focus on growth in the research world and research activity, the model demonstrates activities enabling faculty members to grow as expert researchers at various levels and dimensions of expertise.

How should the ISE Model be used?

The distinction between the ISE model stages is clearly dichotomous, but it is recommended it be viewed as a modular distinction. Growth steps are built layer after layer, with each layer founded on the previous one and a basis for continued growth. It is important to consider the notion that transitions between stages are not always visible, clear and/or unequivocal. In the daily reality of academic work, these transitions occur over time and naturally depend on researchers' personalities, their willingness to cooperate with others, to invest efforts and time, and to work to disseminate the fruits of their expertise as researchers (Avalos, 2011; Dinkelman, 2011; Murray, 2014).

The ISE Model stages can serve as milestones for faculty interested in examining their progress and achievements and exploring how it is worthwhile, desired and possible to continue to invest resources to continue growing.

What is the contribution of the ISE Model to teacher educators?

The ISE Model highlights the important place of teacher educators functioning both as excellent and quality lecturers and as expert researchers. This importance derives from the nature of their profession and being role models for the next generation of teachers. Teacher educators should prompt their students operate as teacher researchers themselves, exploring their professionalism, their work, their achievements, and the achievements of their pupils. Conduct as researchers carries a number of benefits: it allows examination from time to time of professional and academic progress, enables acquisition of diverse, innovative and up to date teaching and learning skills, enables acquisition of means and tools to meet the changing needs of students, allows them to be lecturers updated in the world of knowledge in their specialist teaching areas and the field of teacher education, it allows them to get to know profoundly the teaching and education systems, and enables teacher educators to be among those leading the body of knowledge in the teacher education profession and education systems and to make their mark.

Introduction

Continuing professional development (PD) lies at the heart of efforts to maintain and improve teachers' knowledge and practice once they enter the workforce, complementing and extending their initial teacher education and induction experiences. Across the OECD, participation in PD is near universal, with 94% of teachers and 99% of principals, on average, engaging in at least some form of ongoing professional development (OECD, 2019). Indeed, PD is mandatory in many jurisdictions, with teachers required to undertake a minimum number of hours in a designated period if they are to retain registration, renew their teaching license, or apply for promotion. Increasingly, PD is considered essential to, even inseparable from, school improvement and large-scale educational reform (Garet et al., 2001; King, 2014) and a key mechanism in improving student outcomes (Yoon et al., 2007; Darling-Hammond et al., 2017). As a result, teachers are explicitly positioned not only as lifelong learners, but also as fundamental enactors of education policy and change (OECD, 2019).

Traditionally, PD has been conceptualized as teachers learning new knowledge and skills to put into practice upon returning to their classrooms. The key measure of its success stemmed from self-reported teacher satisfaction (Desimone, 2011; Hill et al., 2013). More recently, the rising accountability policy climate has spurred on efforts to directly link PD to measurable student impact, using empirical evidence gathered in classrooms and schools. Arguably, this newer expectation of PD is grounded in a process-product view of causality (Opfer and Pedder, 2011) linking engagement in "effective" PD with improvements in instructional practice and, by extension, student learning and achievement gains. In this way, what is "effective" has become synonymous with measurable impact, and substantial research attention is now directed toward understanding how and why PD "works." In the current moment, high quality PD programs are increasingly seen as those that significantly improve student outcomes, in addition to—and as a direct result of—building teachers' capacity for effective teaching.

Investing in effective professional development

This shift in focus has been accompanied by a widespread view among scholars and policymakers that governments should be investing, and encouraging participation, in "effective PD" (Garet et al., 2001; Hill, 2009; Desimone, 2009). Given that PD is estimated to cost billions of dollars annually (Birman et al., 2007; Wei et al., 2009), it makes sense to direct money toward activities that generate decent return on investment. However, the true costs of PD are likely to be vastly underestimated, given difficulties in capturing consistent measures of expenditure that account for the full range of funding costs and sources, as well as the lack of rigorous, comparable data across jurisdictions (Hawley Miles et al., 2004; Hill, 2009). For example, the budget for PD in one US school district was initially reported to be around USD \$460,000 but, after closer scrutiny, later calculated to be USD \$8.9 million (Miles and Hornbeck, 2000). Such discrepancies occur because the substantial teacher and school time required for PD is not fully acknowledged—such as regularly funding teacher release and the costs associated with employing coaches, mentors, and curriculum specialists (Jacob and McGovern, 2015).

Directing investment toward impactful forms of PD is hampered by the fact that, in many countries, continuing professional development for teachers is essentially a "marketplace" (Hill, 2009). A wide array of competing providers vie for money, time, and attention, but not all deliver high quality programs. Indeed, much PD has been described as "intellectually superficial," "woefully inadequate" (Borko, 2004) and "uninspired" (Hill, 2009); criticisms that continue to be made even after the shift away from the dominance of episodic, individualistic, and "one-shot" forms of PD traditionally associated with in-service staff development (Borko et al., 2010; Avalos, 2011). Furthermore, PD is often conducted without any formal evaluation, so that there is little rigorous evidence to demonstrate success (or failure) in improving teachers' knowledge and practice, let alone student outcomes. As Hill (2009) succinctly puts it, "the challenge [now] is how to improve the quality, not the quantity, of what is available" (p. 473).

Not surprisingly then, in the current PD marketplace, school systems tend to see meagre returns on investment. This point has been starkly illustrated in a well-known report from the education non-profit organization, The New Teacher Project (TNTP), which invokes the analogy of a “mirage” in arguing that we are yet to develop a sound evidence base for directing money toward effective PD, particularly at scale (Jacob and McGovern, 2015). Based on an examination of three public school districts in the US, Jacob and McGovern (2015) found that the vast majority of teachers did not significantly improve their practice despite a sizable investment of USD \$18,000, on average, per teacher, per year; representing 6–9% of a district’s annual operating budget. Rather, approximately five out of every 10 teachers in the study maintained their current level of instructional performance over several years while teaching quality actually declined for two of every 10 teachers.

Governments and policymakers across the globe want to know how to strengthen the capacities of teachers and achieve substantial impact on student learning. Given that rigorous research into effective PD is relatively scant, researchers now have even more reason for investigating the effects of PD on teachers and students. Meanwhile, however, an informal consensus has emerged concerning key elements or design features that are thought to underpin, or even maximize, effectiveness. Our aim in this article is to interrogate that consensus. In so doing, we raise questions about rigor and methodology, highlight recent advances, and identify important future directions in continuing to build knowledge in the field.

What is effective professional development?

In an attempt to identify best practice, the phrase “effective PD” has become a mainstay in the literature on teacher PD. While “effectiveness” can have many meanings, it is typically used to refer to PD activities associated with positive changes in teacher knowledge and practice, and/or positive changes in student outcomes. More often it is the former, rather than the latter, that is the topic of investigation, or at least the subject of published results.

The primary focus of researchers and policymakers has been to identify the key design features or characteristics of PD programs that have shown success, usually derived from conducting literature reviews, synthesizing empirical data and/or reviewing policy documents. By and large, this approach is grounded in a belief that there is a core set of characteristics that work to make PD effective, particularly in terms of its structural and logistical dimensions. Typically expressed as lists, these articulations of core characteristics arguably amount to a new consensus, emerging among scholars, about specific factors that are crucial to PD’s effectiveness (Penuel et al., 2007; Desimone, 2009).

In general, the consensus revolves around the following features: a focus on curriculum content, including discipline-specific content knowledge and pedagogy; active learning; collaboration between teachers across grade levels, schools, or districts; a sustained duration over an extended period of time; modeling of best practice; the use of coaches or expert support; opportunities for feedback and reflection; and coherence with school and teacher priorities, so that PD is aligned with broader policies and/or reform efforts (Garet et al., 2001; Desimone et al., 2002; Desimone, 2009, 2011; Darling-Hammond et al., 2017). Importantly, these features reflect the shift away from earlier didactic approaches, long condemned for being intellectually superficial, top-down, rigid, disconnected from classroom practice and school context, and providing little to no room for teachers to exert any control over their own learning (Ball and Cohen, 1999; Wilson and Berne, 1999).

The salience of this consensus as a new orthodoxy is manifest in arguments made by a number of prominent scholars. It has been claimed, for example, that these are *the* features of PD worth testing (Wayne et al., 2008), and that we currently have enough empirical evidence so that future studies ought to narrow their focus to these specific elements in order to better understand their relative importance (Desimone, 2009). Further, that these features should form the basis of a shared conceptual framework for studying PD in order to move the field forward (Desimone, 2009). Such a plan would certainly provide a clear basis for what to measure and subsequently attain a degree of consistency across studies, including those conducted in different jurisdictions and contexts. But it may also limit new ways of thinking about powerful PD. And what if the evidence on effectiveness is itself questionable or less than ideally rigorous?

Interrogating the evidence for effective professional development

Despite the new orthodoxy, PD is yet to have the kind of impact sought by policymakers, researchers and teachers themselves. Indeed, the consensus on core features of effective PD has not escaped criticism, which calls into question whether it is productive to take these lists as a starting point for conceptualizing and measuring effective PD. We highlight five main concerns.

First, the evidence base that underpins the consensus is relatively weak. Soon after articulations of effective PD began to appear, doubts were raised about the criteria on which effectiveness had been judged. In particular, Guskey (2003) identified two methodological issues that compromised the rigor of contributing studies: (1) many of these lists were simply derived from self-reported survey data gathered from teachers about changes in their knowledge and instructional practice; and, (2) several of the lists had been formulated based on the views of PD researchers following scans of the literature. Rarely were the key elements of effective PD derived from empirical research that rigorously established a relationship between PD and gains in student achievement. As Guskey (2003) succinctly put it at the time, “the best that can be said, therefore, is that researchers and educators *generally favor* these characteristics and *believe* they are important, despite a lack of verifying evidence” (p. 9; emphasis added). And yet, the very same design features have continued to underpin articulations of effective PD some 15 years later (Darling-Hammond et al., 2017).

Second, rigorous experimental and quasi-experimental designs in PD studies challenge the consensus on effective PD. A review of more than 1300 studies claiming to demonstrate the effect of PD on student achievement found that only nine studies actually met rigorous evidence standards according to the US Department of Education's *What Works Clearinghouse* (Yoon et al., 2007). Given this tiny proportion of acceptable studies, no clear patterns were discernible in terms of key design elements. The PD in these successful studies varied by content (including curriculum content and pedagogy), contact hours (from as few as 5 h to 100 h), and duration (from four weeks to one year). These studies were also typically derived from a single PD activity in a single context, and delivered by the researchers or their associates—common methodological weaknesses in the broader field of teacher PD. Given that PD is often locally developed and research is often undertaken by the developer of the PD program (Borko, 2004; Wayne et al., 2008; Hill, 2009), such studies typically fail to address how the local success of a PD intervention might translate into effectiveness in other broader contexts.

Third, the consensus tends to gloss over the fact PD which includes the desired design features is often unsuccessful at improving student outcomes. This point is highlighted in the results from three large-scale randomized controlled trials (RCT) conducted by the Institute of Education Sciences in the US (Garet et al., 2016). The PD under examination included the design elements that have come to be associated with effective PD, namely: a focus on curriculum content and content-specific pedagogical knowledge; opportunities for collaboration; sustained duration over the course of a school year; the use of experts to lead the intervention workshops; and, in-school coaching throughout the year involving modeling and feedback (Garet et al., 2008, 2010, 2016). While, on average, the PD in these studies produced a significant positive impact on teachers' knowledge and instructional practice, it did not translate into improvements in student achievement (Garet et al., 2016).

Fourth, the consensus lacks clarity of focus (Guskey, 2003; Wayne et al., 2008). If, for example, a focus on curriculum content is critical to effective PD, which curriculum design features matter most? What exactly should be the focus? Studies demonstrating a positive link to student outcomes are wide-ranging and discipline-specific, including a focus on student learning and assessment in mathematics (Carpenter et al., 1989), "learning cycles" in science (Marek and Methven, 1991), and instructional routines in reading (Mcgill-Franzen et al., 1999). Similarly, if collaboration among teachers is important, what method is most effective? There are many options here, including communities of practice (Gallagher et al., 2017), shared lesson planning (Gersten et al., 2010), or interactive forums (Shaha and Ellsworth, 2013). And, if it is recommended that coaches are used, what should their engagement look like? A range of possibilities have been suggested, such as onsite or remote observations (Powell et al., 2010), coaching sessions involving reflection and questioning (Allen et al., 2011), and the analysis of videoed lesson segments (Allen et al., 2015). Such questions apply to every one of the key features that are said to be essential for the design and implementation of "effective PD".

Finally, most PD programs incorporate a host of features and design elements—what Hill (2009) refers to as a "package"—making it difficult to discern which elements actually contribute to success (or failure) and how. This challenge is exacerbated because the PD package also extends to the theory of teacher change and theory of instruction embedded within the design of the program (Wayne et al., 2008), core components of PD which are often disregarded when only the design elements are privileged in the new orthodoxy. How then might governments and school systems ensure investment in PD is directed appropriately?

The complexities outlined above signal an urgent need to keep interrogating the current orthodoxy, rather than simply continuing efforts to refine features of PD which might have gained undeserved or unwarranted status. In the remainder of this article, we contribute to such an examination by problematizing two of the most widely cited and accepted design elements which consistently appear in lists of effective PD: the centrality of curriculum content and the need for coaching. Through this analysis, we aim to demonstrate why it is important to think differently about what constitutes effective PD and raise questions about the new orthodoxy.

Interrogating the primacy of curriculum content in effective PD

A focus on curriculum content is a central plank of the new orthodoxy, a design feature which appears in almost all articulations of effective PD. Indeed, it has been proposed that discipline-specific content knowledge and/or pedagogies is the "most influential" feature of successful PD programs (Desimone, 2009) and even the "most relevant and striking" characteristic associated with success (van Veen et al., 2012). The premise here is that increasing teachers' knowledge of their subject and how to teach it is key to improving their practice, thus helping to achieve positive gains in students' subject-specific outcomes. This view is similarly evident in recent TALIS data indicating that teachers believe content-driven PD to be one of the most impactful forms of PD they have experienced (OECD, 2019). Content-focused PD is also highly attended by teachers, with approximately 75% of teachers on average across the OECD reporting that they have participated in PD focused on understanding their subject or discipline, and 72% of teachers reporting that their PD activities have covered subject-specific pedagogical competencies (OECD, 2019). These figures are not surprising given the importance of subject-matter content and pedagogical content knowledge (Shulman, 1986) to teaching, and teachers.

However, despite this perceived impact on practice, demand for content-driven PD is relatively low. In fact, the same TALIS data demonstrates that very few teachers report needing this form of PD, instead wanting more pedagogy-focused PD, such as teaching students with special needs, using ICT in the classroom, or teaching in a multicultural or multilingual setting (OECD, 2019). On the one hand, this inverse relationship may simply be a function of supply and demand; teachers might not report a desire for content-focused PD if it is already provided on a regular basis. On the other hand, the mismatch between supply and demand potentially signals teachers' need for different forms of PD not directly connected to a specific subject or discipline. Plausibly, the high degree of impact believed to be associated with content-focused PD might therefore be due, at least to some degree, to provision.

The very nature of content-focused PD also means that the PD activity narrowly targets a specific group of teachers often working in a single discipline. Most PD interventions shown to have been effective—resulting in changes in teachers’ practices and student learning outcomes—are in the disciplines of mathematics, science, or English/language arts (Darling-Hammond et al., 2017; Yoon et al., 2007). While academic achievement in these disciplines is often easier to measure than in other subjects due to the availability of standardized tests, the dominance of these content-focused interventions essentially reflects the hegemony of “core subjects” in many state and national curricula.

With content-focused PD dominating the literature on effective PD, much less has been made about the value of pedagogy-focused PD. This relative inattention is surprising given the emergence and growing popularity of many “generic” observational instruments used to measure effective teaching, such as the Framework for Teaching (FFT) and the Classroom Assessment Scoring System (CLASS). While FFT focuses on the effectiveness of teachers in a wide range of areas, including planning and preparation, the classroom environment, instruction, and professional responsibilities (Danielson, 2007), CLASS looks more specifically at daily teacher–student interactions, particularly in terms of emotional support, instructional support, and classroom organization (Pianta et al., 2008). As such, both frameworks can be—and are—used *across* subjects and disciplines.

Research on these “generic” observational instruments, which can be applied in all teaching contexts, is promising in terms of pinpointing “what works” to foster student achievement. For example, the large-scale Measures of Effective Teaching (MET) project found that both FFT and CLASS are just as correlated to increases in student outcomes in mathematics and English/language arts as subject-specific observational instruments (Bill and Melinda Gates Foundation, 2012). Although the MET project focused on observation rather than professional development, this finding suggests that teachers can use a generic pedagogical model to examine—and improve—their practice in different subjects, rather than having to use a subject-specific instrument aligned with the curriculum area being taught.

Rigorous studies of pedagogy-focused PD have also demonstrated gains in student achievement, further calling into question whether a focus on discipline-specific content is essential to effective PD. Evidence from Yoon et al.’s (2007) early review of the field identifies two generic forms of PD that show positive effects on student outcomes under RCT conditions. Both forms of PD focus on teaching behaviors and instructional strategies applicable to all subjects (Cole, 1992; Sloan, 1993). More recently, our own research on Quality Teaching Rounds (QTR)—a pedagogy-focused approach to PD that combines the benefits of teaching rounds and professional learning communities with a comprehensive pedagogical framework—has similarly demonstrated noteworthy improvements in student achievement. Using a cluster RCT design, students of teachers in the QTR group made 25% more progress in mathematics than the control group, or approximately two months additional growth over an 8-month period (Gore et al., 2021). This form of PD has also shown significant positive effects on the quality of teaching, teacher morale, and sense of recognition under RCT conditions (Gore et al., 2017), illustrating that the impact of pedagogy-focused PD can be significant for both students and teachers.

Pedagogy-focused PD has also been shown to have additional benefits. The capacity to collaborate is often constrained when participating in content-focused PD, because teachers usually work with colleagues from the same subject or discipline. By contrast, pedagogy-focused PD, such as the QTR approach, has shown the powerful benefits of working with, and observing, teachers across subject boundaries (Gore and Rosser, 2020). Participating in QTR PD not only enhanced collegiality across grades and subjects, but it helped teachers refine their practice by generating new insights about their pedagogy and their students—in large part because they were working with *diverse* rather than *similar* colleagues from across the whole school (Gore and Rosser, 2020).

Overall, we argue that the potential of pedagogy-focused PD—for both students and teachers—has largely been overlooked in literature on effective PD. Instead, most research has focused on content-focused PD, producing more published results on the effects of content-focused PD, leading to further research, thus embedding content-focused PD as core to the consensus. Our brief analysis here begins to problematize whether a focus on curriculum content is necessary for effective PD.

Interrogating the role of coaching in effective PD

A second PD design feature common to almost all articulations of effective PD is the need for coaching, a practice that has dramatically increased in the past two decades (Mangin, 2009; Biancarosa et al., 2010; Coburn and Woulfin, 2012; Jacobs et al., 2017). Coaching is underpinned by two key premises. First, that teachers who take part in coaching activities become more adept with planned, intentional practice; and second, by breaking teaching into its parts, and practicing those parts, coaching can be a powerful means of achieving professional learning (Gore, 2020).

The increasing acceptance of coaching as a component of effective PD is reflected in the many forms of coaching that currently exist (Deussen et al., 2007), including peer coaching (Joyce and Showers, 1980, 1982), cognitive coaching (Costa and Garmston, 2002), and instructional coaching (Desimone and Pak, 2017; Woulfin and Rigby, 2017). The role of coaches varies significantly based on the requirements of policymakers, departments of education and school leaders. Coaches can work with teachers one-on-one or in a group, to assist with lesson planning and assessment (West and Staub, 2003), student diagnostics (Vogt and Rogalla, 2009) and identifying goals for teacher learning (Borko et al., 2014). Coaches engage with teachers to foster active learning (Kretlow and Bartholomew, 2010) with the most common form being one-on-one communication between coach and teacher (Killion, 2012). In some contexts, coaches also provide continuing PD, lead professional learning communities, co-teach in classrooms and work with small groups of children (Lesley et al., 2020).

Despite the prevalence of coaching and widespread support for it as a key component of effective PD, four main areas of concern arise. First, critics argue that there is a lack of empirical evidence on why, when and how coaching works (Desimone and Pak, 2017), with effects on student outcomes remaining largely unsubstantiated (Mangin, 2009). For example, Neuman and Cunningham (2009) found that a combination of coaching and coursework was required to improve the quality of practice in schools, but they did not provide evidence of impact on student outcomes. In a review of effective PD, Darling-Hammond et al. (2017) found that 30 of the 35 studies included some form of coaching or expert advice. However, these results should be treated with caution. The review does not provide the total number of studies considered (beyond the 35 included in the review), provide an assessment of the quality of evidence provided in the reviewed articles, or consider if coaching was the key factor impacting student outcomes or whether it was a combination of factors (Hill et al., 2013). More recently, in a meta-analysis of 60 studies, Kraft et al. (2018) found that coaching does have positive effects on teacher instruction and student achievement, but the effectiveness of such programs diminishes significantly when attempting to take the programs to scale.

Second, coaching is expensive to implement and to scale. One of the greatest criticisms of coaching relates directly to the allocation of resources, particularly the time and monetary investment required for coaches to build trusting relationships (Knight, 2006). In particular, the financial investment in coaching can be up to 12 times the cost of other forms of professional development (Mangin, 2009). Likewise, inadequate funding can limit the effective implementation of coaching programs (Mangin, 2009).

Third, coaching relies heavily on outside “experts,” which can lead to teachers becoming reliant on those who know better, diminishing their confidence and leaving them uncertain of their skills and in need of sustained external endorsement of their teaching practices (Gore, 2020). Extreme forms of coaching, such as bug-in-ear feedback (Scheeler et al., 2006) can further undermine engagement with the multifaceted nature of teaching (Hargreaves and Dawe, 1990; Horn and Little, 2010).

Last, on a practical level, several factors can mitigate the success of coaching. There is considerable variability in coaching activities and their implementation (Atteberry and Bryk, 2011). Teachers can be unwilling to work with coaches to change their instructional methods (Deussen et al., 2007). Coaching can slip into supervisory practices aimed at supporting specific performance targets (Lofthouse and Leat, 2013). And, coaches are often classroom teachers who may not have the skills and training necessary to be effective in those roles (Gallucci et al., 2010; Poglinco and Bach, 2004).

Arguably, the focus on coaching as a key aspect of effective PD has obscured the impact of other programs which might exclude coaching but show demonstrable positive impacts on student outcomes. For example, a program of research examining the impact of a web-based, on-demand form of professional development on student achievement has consistently found positive effects, (Shaha and Ellsworth, 2013; Shaha et al., 2015; Shaha and Glassett, 2016) despite not including a coaching component in the design of the PD program. Other successful programs such as QTR are designed to foster peer support to do the “heavy lifting” of PD and can be enacted almost entirely by teachers without external input (Gore et al., 2017). While Kraft et al.’s (2018) meta-analysis found that coaching works, the positioning of coaching as the latest holy grail of effective PD may be ill-considered. The 60 studies in this metanalysis were primarily literacy coaching programs provided to teachers of pre-kindergarten and elementary school students in the United States, without wider applicability to other contexts or subject areas. In sum, we question whether the enduring consensus on coaching as a key feature of effective PD, like the centrality of content, might be obscuring the significant benefits of other approaches.

Where to next?

Our analysis of just two of the design features that constitute the new orthodoxy on effective PD demonstrates how important it is to keep raising questions and conducting research to explore what constitutes effectiveness. Despite the many benefits associated with structuring and framing research and practice in PD, we propose that the field has embraced the informal consensus prematurely and uncritically. This is not to undo or undermine the advances made. Rather, we call for scholarship and research, both conceptual and empirical in nature, that opens up the field with ongoing exploration of how to meet teachers’ professional learning needs. At the same time, we call for greater sophistication and rigor in how PD is conceived and researched.

The problem of PD not being effective—that is, not impacting positively on teachers or students—may have more to do with the nature of what is on offer than it does with particular design features (Gore and Rickards, 2020). Regardless of the specific design features utilized in a PD program, teachers may resist the PD for a host of reasons including: to regain agency and carve out their own learning trajectories (Achinstein and Ogawa, 2006; Flint et al., 2011; Musanti and Pence, 2010); because they are unwilling to take the attendant risks (such as threats to their experience, to power relations, and their perceived expertise) (Zimmerman, 2006); or, on principle, given a fundamental difference in educational beliefs (Achinstein and Ogawa, 2006). Indeed, many teachers are resistant even to newer, more collaborative forms of PD that directly align with the current consensus (Achinstein and Ogawa, 2006; Musanti and Pence, 2010). As such, we must think of PD as more than a set of design features. It needs to be positioned as part of a system, embedded within policies and school cultures and its success needs to be recognized as contingent on teachers’ willingness to actively engage.

At the same time, if we are to learn more about effective PD in ways that inform the investments of governments and systems, then we need to examine both the methodologies being used and the quality of evidence underpinning claims to effectiveness (Sims and Fletcher-Wood, 2020). This does not mean buying simplistically into accountability culture or only supporting experimental studies. Instead, as researchers and PD providers in the field, we contend that we have responsibility for the quality of our work as well as our greater responsibility to teachers and their students. Moving forward, we must therefore continue to pursue knowledge and interrogate current understandings and new orthodoxies.

In sum, the enduring focus on lists of key design features of effective PD may be obfuscating and restraining the field rather than moving it forward. More than seven years ago, Heather Hill and colleagues (Hill et al., 2013) argued that we had reached a crossroads in PD research, with an urgent need to provide “more rigorous evidence” (p. 476). While there are signs that the field is slowly moving toward ensuring higher quality evidence (see for example, Kraft et al., 2018), there is still much to be done to support our understanding of what makes PD effective. Such efforts, we argue, should include rigorous trialing and evaluation of PD, including forms that do not align with the current consensus. This requires thinking about new ways of creating, designing and implementing PD, rather than too-quickly subscribing to any particular orthodoxy. Ultimately, it means encouraging innovation, inviting the field to think beyond current practice, and inspiring the next generation of researchers to contribute fresh insights to the evolution of the field.

Introduction

The common discourse surrounding teaching quality stresses the connections between quality teaching and on-going teacher learning (Avalos, 2011; Kennedy, 2016; Organization for Economic and Cooperation and Development [OECD], 2016) for the ultimate purpose of improving student learning. The literature on teacher learning predominantly associates teacher learning as a consequence of some type of formally structured professional development (OECD, 2014; Kwakman, 2003; Richter et al., 2019) but recognition of the need to ensure teacher learning is not only sustainable but relevant to their contexts has caused researchers to explore new approaches to teacher professional learning (Superfine, 2019). In a recent review of Australasian research on teacher professional learning and development, Bobis et al. (2020) noted increased attention on teacher noticing as a strategy for their professional learning. This growth in attention was regularly grounded in the importance of teachers learning from their everyday practices and the presumption that the support mechanisms surrounding such learning were more sustainable than that stemming from structured programs of professional development (Chan et al., 2018). Despite the growing recognition of teachers' in-situ learning and the role it can play in improving classroom practices in the research literature, the authors concluded that there was "an evidence void" surrounding "the ways in which teachers learn from their daily practice" (p. 139). Bobis et al. called for increased attention to research in this area to build our understanding of how we might improve the capacity of teachers to learn from their everyday practice.

In this paper we explore the emerging field of teacher noticing as a vehicle for on-going professional learning that is situated in everyday mathematics classrooms. Our aim is to build upon and add new insights to teachers' professional learning by proposing strategies and mechanisms to support teachers learn how to notice what matters most in the mathematics classroom, and how such learning can be used to improve their practice. First, we review relevant theory and literature on teacher professional learning spotlighting in-situ learning and merge it with recent insights from research on teacher noticing. We then draw upon an example from our own classroom-based research to elaborate and reflect upon important aspects of teacher noticing relating to our focus.

Teacher professional learning

The terms professional development and professional learning are often used interchangeably in the literature. Increasingly professional learning is recognized as the product of external and workplace-embedded professional development activities that assist teachers acquire new knowledge and help them improve their practices in ways that will benefit student learning (Bobis et al., 2020; Darling-Hammond et al., 2017). Therefore, professional learning is much broader than professional development, but may not always result from a teacher's involvement in such activities.

The benefits of teacher professional learning have been associated with enhanced student outcomes and teaching quality (Darling-Hammond et al., 2017), and the development of teacher knowledge, beliefs and practices (Beswick et al., 2016). There are also cases where studies of teacher professional development outcomes have shown little or no positive effects (Garet et al., 2010) even when the programs in question incorporated certain characteristics associated with high quality professional learning (Richter et al., 2019; Bobis et al., 2020). The reasons for these conflicting findings vary. Kennedy (2016) argues that it is not

necessarily the program characteristics that are important but the underlying theories of action that determine their success. Others, such as [Lindvall and Ryve \(2019\)](#), suggest that the various outcomes might derive from the fact that researchers in the field define and apply the characteristics associated with so-called “effective” programs of professional development differently. For example, Lindvall and Ryve conducted a systematic review of professional learning and development literature focusing on the feature of coherence—the degree to which a program of teacher learning aligned with other aspects of teachers’ work and contexts. The researchers found that the term was conceptualized in many different ways, with the result that studies claiming to investigate the same feature were in fact studying very different things and were therefore unsurprised that findings varied across studies. They reflected on the fact that teacher professional learning occurs in a wide range of real-world contexts and that research in the past often neglected to account for the complexity of teachers’ workplaces. This neglect has occurred despite an awareness that from the perspective of teachers, professional learning is considered more effective the closer it is connected to the workplace and situated in their daily practices ([Beswick et al., 2017](#); [Kwakman, 2003](#)).

Teacher learning as situated in the classroom

Inspired by both situated and cognitive perspectives of learning, we view teacher professional learning as an agentic, constructive and social process in which the opportunity for learning is embedded in everyday practices. [Clarke and Hollingsworth’s \(2002\)](#) interconnected model of teacher growth aligns with such a perspective of teacher professional learning. Characterized as four domains—personal, external, practice and consequences—it focuses on the various relationships between different aspects of professional learning and the multiple pathways that such learning can take (see [Fig. 1](#)). The model acknowledges teachers as active and reflective learners who are influenced by society and their learning environment. Teacher agency is emphasized by the importance placed on professional experimentation, with enactment and teacher reflection proposed as the essential connecting mechanisms for teacher learning. The centrality of knowledge and beliefs emphasizes the construction of teacher knowledge as both a consequence of, and stimulus for, reflective involvement in professional learning activities and practice. For example, depending on existing knowledge and prior beliefs, a teacher may value higher order reasoning and thus regularly provide her students with mathematical opportunities requiring them to justify their thinking. As a consequence, she is also more likely to notice such thinking (or lack of) in her students and seek out professional learning resources to experiment with in the classroom and, depending on the salient outcomes, modify her practices accordingly. More importantly, Clarke and Hollingsworth’s model conceptualizes the process of teacher learning as interconnected and multi-directional across domains. This implies that learning in both the personal domain and the domain of practice can conceivably emanate from the very act of teaching and not, like in other linear models of teacher learning (e.g., [Guskey, 1986](#)), as a precondition for that practice to occur.

Although the classroom might be considered in theory an ideal and powerful context for teachers to learn while on-the-job, it seems that in practice, few professional learning activities or research projects have focused on teacher learning from the act of teaching itself ([Kwakman, 2003](#); [Margolinas et al., 2005](#)). Recently, there has been growing recognition of the important role social processes involving collegial interactions, self-directed learning and reflective practice play in teacher learning, which has seen an increase in professional learning approaches that are focused on situating teacher learning in the classroom. Two such approaches are lesson study (e.g., [Choy, 2016](#); [Groves and Doig, 2016](#)) and teacher noticing ([Chan et al., 2018](#); [Hollingsworth and Clarke, 2017](#)).

Fig. 1 Interconnected model of teacher professional growth. Reproduced with permission from Elsevier, [Clarke and Hollingsworth’s \(2002, p. 951\)](#).

Taking account of the growing body of literature surrounding teacher noticing, Chan et al. (2018) posited that when “teaching a lesson, teachers learn from the things to which they attend” (p. 92) and that a teacher’s attention is influenced by their prior knowledge and beliefs, the intentions of the lesson, and the context in which the lesson is enacted. Building on Clarke and Hollingsworth’s (2002) model of teacher professional growth, Chan et al. proposed a framework to conceptualize teacher learning as situated in their everyday practice (see Fig. 2).

Central to Chan et al.’s. (2018) conceptualization of situated learning is teacher selective attention—a major component of teacher professional noticing.

Teacher noticing

Noticing in the classroom is a common skill of teaching that has long been acknowledged, discussed and studied by mathematics educators and researchers for its potential to improve the quality of teaching and, thus, student learning (e.g., Franke et al., 1998; Mason, 2002; van Es and Sherin, 2008). It is also acknowledged that learning to notice the things that matter most in classrooms is complex, challenging and an important part of developing expertise as a teacher (Jacobs et al., 2010). It is this capacity to notice the important things in classrooms that sets apart an expert teacher from what a novice teacher or lay person might notice. This type of expert noticing is variously referred to in the literature as professional vision (van Es and Sherin, 2008), professional noticing (Jacobs et al., 2010) and intentional noticing (Mason, 2002). In this paper, we adopt Mason’s intentional noticing terminology to refer to the collection of practices teachers use to purposefully notice features of teaching and learning that are valued.

Central to the discipline of noticing is the necessity of paying attention to something (Mason, 2011). Research consistently confirms just how challenging it is for even experienced teachers to filter out what is worthy of their attention from the complex array of classroom events—particularly while in the very act of teaching (e.g., Jazby and Widjaja, 2019; van Es and Sherin, 2008). What teachers attend to in the classroom is influenced by their knowledge, beliefs and prior experiences of teaching. Therefore, noticing is a subjective process that is influenced not only by what one knows but also by what one believes to be important. For example, if a teacher believes that mathematics is a set of facts and procedures to be learned, they might pay attention to instances when students obtain correct answers to number facts and not attend to the point that some students used inefficient counting-by-ones strategies to do so. Moreover, research findings from the field of psychology (e.g., Simons, 2000) and mathematics education (e.g., Mason, 2011) tell us that people generally do not attend to events that they do not expect to see or if they “do” notice them, their response is either an inappropriate habitual response or appropriate but provided too late.

Simon (2007) argued that because teacher in-situ learning is limited by what they notice in the classroom, which itself is constrained by their conceptions and expectations, significant change in teachers is “unlikely to happen solely as a result of a teacher learning from her own teaching” (p. 141). To assist teachers focus their attention on what matters, researchers have suggested conceptualizations and frameworks to not only fine-tune their noticing practices (e.g., Jacobs et al., 2010; Mason, 2011) but to guide the selectivity of their attention-seeking gazes (e.g., Ivars et al., 2018). For instance, Ivars et al. combined Jacobs et al. conceptualization of teachers’ professional noticing of children’s mathematical thinking (attending, interpreting and deciding how to respond) with a hypothetical learning trajectory of part-whole fractions to guide preservice primary teachers’ noticing of students’ mathematical thinking. The researchers found that the learning trajectory helped focus the teachers’ attention on important milestones in students’ understandings of fractions.

Similarly, the process of intentional noticing is conceptualized by Mason (2011) as involving three interrelated practices: “preparing” to notice, “post-paring” by reflecting on recent events to select what one wants to notice, in order to “pare”, or to notice in the moment. Preparation to notice and respond are key activities in this process. During these preparation phases, Mason stresses the importance of pre-selecting the events likely to occur as a consequence of the stimuli provided by the teacher. Such stimuli could include the entire learning context but particularly the topic being studied, tasks, questions and resources used throughout the lesson. Pre-selecting which event teachers wish to focus upon means that they can pre-prepare what to notice. For instance, if a teacher pre-selects to focus upon students’ reasoning about, and strategies for mentally solving 2-digit by 1-digit multiplication problems, she might then prepare to notice using the following steps. She first reflects upon student responses to recent tasks on the same or a similar topic and draws upon her existing knowledge about student thinking strategies, possibly referring to an existing research-based learning trajectory to guide her pre-selection. She might also draw upon her curriculum and mathematical content knowledge. Based on this knowledge and experiences, she then anticipates three or four likely strategies her students will use and their explanations for using them.

Fig. 2 Conceptualization of teacher learning from teaching. Modified from Chan et al. (2018, p. 92).

Next to each of these anticipated responses she prepares her own responses with the intention of eliciting deeper thinking in the students and providing appropriate prompts that will lead them to using more efficient mental strategies; consulting a hypothetical learning trajectory once again to provide greater directionality in her prompts for student strategy progression.

We agree with [Chan et al. \(2018\)](#) and consider teachers' capacities to select what to attend to as a critical determinant of not only their ability to notice what matters in the classroom but to learn from their everyday classroom experiences. Starting with Chan et al.'s conceptual framework ([Fig. 1](#)), we add the practice of anticipation ([Stein et al., 2008](#)) and combine it with [Mason's \(2011\)](#) approach of pre-paring a collection of appropriate teacher responses. Using this collection of practices to purposefully plan a lesson will reduce the likelihood of a teacher responding habitually to an event or with an inappropriate response such as simply "telling" students answers. To further assist teachers learning from these everyday classroom events, we recommend teachers reflect post-lesson upon what "surprised" them during each lesson—What happened that they did not anticipate and how will this new information impact what they do differently (or keep the same) in the future. Such reflective prompts might bring to the surface a new and important experience for a teacher to learn from and improve their instruction that would otherwise have gone unnoticed. This type of in-situ learning is only enacted and observable when a subsequent lesson is employed to consolidate the learning of students and the teacher.

In the next section we present an example of how one elementary teacher combined the principles and practices of intentional noticing previously outlined with a hypothetical learning trajectory for multi-digit multiplication. The study was conducted as part of Tripet's larger doctoral project with the dual aims of exploring student learning and her own learning from the everyday practices of planning and teaching mathematics.

Exemplar from a classroom-based research project

In this study, I took on multiple roles: teacher, learner and researcher. The focus of intentional noticings and the incidental observations that were made in the classroom were greatly influenced by the theoretical perspective of the research. Realistic Mathematics Education (RME) was used to guide the design of the classroom-based study and analysis of data. RME is founded on the belief that mathematics is not a closed body of knowledge to be transmitted. Rather, it is an exercise in which learners are active participants ([van den Heuvel-Panhuizen, 2003](#)) as they "reinvent" conventional mathematics for themselves, as part of a process of mathematization ([Gravemeijer, 2004](#)).

As the teacher, I consider my role in the classroom as a proactive one in which I need to guide my students' activity of reinvention. My constant challenge is to pay careful attention to students' thinking and to capitalize on inventions as means of developing their understanding of important mathematical concepts. To realize this, I regularly use existing learning trajectories to form the basis of my teaching programs. As "a vehicle for planning learning of a particular concept" ([Simon and Tzur, 2004](#), p. 93), a learning trajectory identifies the key mathematical understandings in a given domain and hypothesizes the path by which student learning might proceed. As such, trajectories shift the focus of the teacher from transmitting content to noticing and making sense of students' cognitive constructions.

In my study, a hypothetical learning trajectory was used to map the predicted path of my students' reinvention in the domain of multi-digit multiplication. I used the trajectory to help anticipate students' likely constructions, to guide their constructions and support their progressive mathematization.

Developing the learning trajectory

Hypothesizing the learning trajectory was akin to Mason's "pre-paring". The trajectory highlighted that which was mathematically significant in the domain, and therefore, that which was important for me to notice. Since an existing learning trajectory for multi-digit multiplication did not exist at the time of this study, I used a sequence of anticipatory thought experiments to delineate my own. First, I conducted a detailed review of relevant literature. The purpose of this review was to draw on existing knowledge of students' thinking in the domain and to improve my own mathematical content knowledge of multi-digit multiplication, with the intention of improving my capability to notice mathematical significant happenings in the classroom. Using this literature review, a draft trajectory was constructed for how students' learning might proceed. The draft identified the key developmental understandings of distributivity and associativity and the mathematical significant aspects of students' constructions of which I should be mindful.

The draft trajectory was then placed in the context of the classroom in which I was teaching. One-to-one interviews were conducted with all the students to assist my understanding of their current levels of reasoning in multiplication. Learning goals and instructional starting points for the sequence were clarified based on these interviews, and tasks designed to elicit the type of thinking desired. Key to this stage was my anticipation of students' solution strategies for each task, and how these strategies were indicative of the key developmental understandings noted on the trajectory. For each strategy anticipated, possible responses were also prepared. Planning in this way was intended to encourage a shift from responding habitually to students and events in the classroom to responding purposefully.

Implementing the learning sequence

The learning sequence was implemented over a two-week period and comprised four teaching episodes. Each episode was characterized by a focus on a distinct concept and spanned two or three 1 h lessons. An episode commenced with a contextual problem to

which students were asked to provide a solution and an explanation of how their solution worked. This section reports on the first three teaching episodes and describes the significant aspects of students' constructions that were noticed and the subsequent instructional decisions that I made as a consequence.

Teaching episode 1—noticing students' use of the distributive property

The first teaching episode focused on building students' understanding of the distributive property of multiplication. Using the context of a bakery, the students were presented with a narrative that prompted them to calculate the total number of cupcakes baked in a day. The cakes were presented pictorially to students as a large array.

Strategies that drew on distributivity were anticipated in the trajectory as studies indicate that the distributive property is an intuitive concept for many students (Ambrose et al., 2003; Barmby et al., 2009; Izsak, 2004). This was realized with many students using the structure of the array to partition it into place value parts to create manageable calculations. However, one method of partitioning the array surprised me. A small number of students used place value to accurately solve the problem but did not utilize the structure of the array in their partitioning. Instead they removed a section of a row, as illustrated in Fig. 3. This manner of partitioning indicated a disconnect between students' procedural competence and their understanding of the multiplicative structure. The disconnect was reinforced as I further noticed students use a finger to count by ones to determine the number of cakes to separate.

The use of this ineffective strategy determined the focus of the whole class discussion conducted at the start of the following lesson. Initially, I had planned for this discussion to focus on the fact that the array can be partitioned to support efficient computation. Based on my previous noticing, I chose to direct students' attention differently: connecting distribution to the multiplicative structure. During the discussion, I presented a number of strategies that used partitioning to the class, including the aforementioned strategy. Comparing the commonalities and differences between strategies, I was able to guide students' attention to that which was mathematically significant, that is, how the structure of multiplication enables efficient distribution, as shown through the array representation. Directing the students' attention in this way prompted them to modify and refine their own thinking and enabled them to build a greater appreciation of how the coordinated rows and columns of an array could be used to aid computation.

Teaching episode 2—noticing students develop an understanding of the associative property

The second teaching episode focused on the associative property of multiplication. For me, a significant learning from the previous task was the importance of focusing on the multiplicative structure, as represented by the array. Episode 2 continued the context of the bakery and, again, the students were required to calculate the total number of cakes in a given collection. In this instance, the cakes appeared in boxes and so were not visible—the array was partially abstracted. Upon solving the problem, the students realized that the total number of cakes in this instance, 16×12 , was the same as the total number of cakes in the first teaching episode, 24×8 . This led to an investigation of a second mathematical goal—why did $16 \times 12 = 24 \times 8$?

During the course of investigation, a number of students noted a certain relationship between the numbers involved, which is reflected in the following excerpt:

Fig. 3 Not separating a full row or column.

Ryan: 12 is half of 24.

Dylan: You could join two of the boxes together to make 24 then ... wait, that's 8 groups ... yeah ... that's 8 groups because 8 twos are 16.

Ryan: So then, 8 is also half of 16 so they are both half.

Dylan: Yeah, I think that's right.

The students had recognized an important numerical relationship, but they had not yet made a connection to the multiplicative structure. I prompted the students to consider how the numerical relationship could be represented using the array. The pair of students took a significant amount of time to make the connection, before dividing the array in half and rearranging it to transform 16×12 into 24×8 (Fig. 4).

Noticing the boys' dynamic use of the array informed my focus of the subsequent lesson. A sequence of associated multiplication problems, specifically focusing on halving and doubling, was presented to the students. In order to highlight that which was mathematically significant, I asked students to represent the different problems using grid paper and to manipulate the arrays to show how each one was connected. Using symbolic recording, and through the course of whole class discussion, students recognized the process of halving and doubling as the associative property of multiplication.

Teaching episode 3—*noticing students' misconceptions with multi-digit numbers*

The intent of the third teaching episode was to extend students' use of the distributive property to two-digit numbers. I presented students with a drawing of the trays inside different cupcake boxes, with the array presented as an area model, or open array. The students discussed why one array was skewed and the other was not (see Fig. 5). The students offered a variety of explanations as to the use of a skewed array, with some hypothesizing that this array was smaller in area and therefore would be cheaper to make. This hypothesis became the focus of the teaching episode.

The initial plan for the class activity was to have students use their own strategies to work out which tray had the larger area. The students were asked to predict if it was true that a tray with dimensions $28 \text{ cm} \times 24 \text{ cm}$ was larger than a tray with dimensions $25 \text{ cm} \times 25 \text{ cm}$. The students' responses were interesting:

Fig. 4 Ryan and Dylan's representation of the associative property.

Response 1:

Ashley: Well, both of them are just 20 multiplied by 20. Then ... well, with that one [indicating the 25 cm $\times$ 25 cm array] you do 5 times 5 and then with that one (indicating the other array) you do 4 times 8 and I think ... um ... wait, it's, yeah, it's 32 and the other one is 25, and 32 is bigger than 25.

Response 2:

Mia: 28×24 is like 26×26 .

Teacher: Why is that? What are you thinking?

Mia: Well, if you take 2 off the 28 that makes 26, and then you just put that 2 with the 24, then it is 26 too. So, it is 26 and 26 and you just times them together and it's obvious ... 26 and 26 will make more than 25 and 25.

Up to this point in the sequence, the students' responses had demonstrated sound mathematical understandings. However, in this instance, both explanations were based on incorrect mathematical reasoning. The literature reviewed indicated that students do not always recognize all partial products in a multi-digit multiplication (Murray et al., 1994; Young-Loveridge and Mills, 2009). As such, Ashley's response had been represented in the trajectory and I had therefore anticipated it. However, Mia's response was surprising—it was not anticipated. Her misconception centered on compensation and I knew that it is incorrect to use additive compensation strategies in a multiplicative context.

Noticing the students' misconceptions led to a significant and spontaneous instructional decision: the problem shifted from having students work out the total areas of each tray, to asking students to show how their explanations worked mathematically and whether they were correct. The students chose to use the array to make sense of their explanations. Although the context of the investigation used an open array, most students selected to use grid paper which displayed the rows and columns of all individual squares in the array. This noticing was significant because it led me to important new insights about how students learn multiplication: students required the flexibility to move between different forms of the array as they engaged in sense-making. In this instance, students made sense of what was occurring mathematically using a more simplistic form of the array. Once they understood this, their learning moved forward again to the more abstract form of the open array.

Teacher learnings from noticing

On reflection of the instructional sequence, two key learnings emerged from my noticing of students' constructions with the array. First, students needed the opportunity to connect multiplicative calculations with the multiplicative structure. In Teaching Episode 1 and 2, students were able to perform calculations accurately, yet were not always able to represent how these calculations worked using the array. Students needed to be afforded time to make these connections for themselves.

The second significant noticing was students' movement back and forth between simplistic and abstract forms of the array. When faced with their own incomplete understandings, students would revert back to the realistic form of the representation: the array with all parts visible. Students would use this form of the array to make sense of what was happening mathematically.

As a teacher, these two learnings had significant implications for my practice. Students need the opportunity to use the array to explore the multiplicative structure. In their explorations, students should not be restricted to one representation of the array. Rather, flexibility is needed. Students should be afforded the opportunity to select and use different representations of the array (from simplistic with all parts visible to more stylistic and abstract forms), recognizing that different representations will serve different functions in the process of sense making.

Learning from teaching

In this paper we have sought to explore the emerging field of teacher noticing as a vehicle for on-going professional learning that is situated in everyday mathematics classrooms. Although our argument for such teacher learning builds on existing research and theory, we have been selective in our use of evidence from just one case study teacher. We acknowledge that learning to notice the things that matter most in classrooms is complex and challenging, but that it is also a critical part of developing the expertise of all teachers and is therefore both an incredibly important research agenda to pursue and practical discipline to refine. Our intention here was not to be conclusive about how teachers learn from their everyday practices. Instead, we aimed to illustrate how providing teachers with a set of interrelated

Fig. 5 Comparing the area of two trays in teaching episode 3.

practices emanating from the work of Chan et al. (2018), Mason (2011) and Stein et al. (2008) can help fine-tune their noticings in their classroom with the potential to stimulate teacher learning and improve their teaching practice. In summary, this set entails teachers:

- (1) Pre-selecting the event to focus upon;
- (2) Pre-paring what to attend to by:
 - (a) Post-paring or reflecting upon student responses to recent tasks on the same or a similar topic, drawing upon existing knowledge and new knowledge from research or curriculum documents;
 - (b) Anticipating likely responses by students and how they are indicative of substantial mathematical ideas/concepts;
 - (c) Preparing meaningful teacher responses;
- (3) Attending to in-the-moment events in the classroom;
- (4) Attending to surprising events post-lesson; and
- (5) Reflecting upon what was attended to and interpreting the implications for future instruction.

Given findings that teacher noticings are limited by their mathematical knowledge and conceptions of what is important (Simon, 2007), we suggest juxtaposing this series of practices with an existing or teacher-generated learning trajectory of student understandings to not only guide the selectivity of teachers' attention-seeking gazes but to support the direction in which their instructional sequences should progress. In some countries, such trajectories are emerging in the form of curriculum materials (e.g., Australian National Numeracy Learning Progressions www.australiancurriculum.edu.au/resources/national-literacy-and-numeracy-learning-progressions/) but also exist in research publications (van den Heuvel-Panhuizen, 2003) and evidence-based texts for practitioners (Clements and Sarama, 2009).

Recognizing the complexity of teachers' work and the intensity of demands on their time and attention in any single lesson, we have embedded the above set of noticing practices into a lesson planning protocol (see Fig. 6). This protocol is intended to be adaptable to teacher contexts and is proposed as an additional support tool for teachers as they learn to embed noticing practices into their everyday work of teaching.

Grade/Class:		Date:
Mathematical focus		Materials:
Learning Intentions/ success criteria At the end of this lesson students can: •		
Language to emphasize		
Lesson Launch / Introduction	Launch the task without 'telling' students how to do the mathematics. Clarify terms to ensure students understand the task.	
Anticipate How might my students solve this problem?		How will I respond? (Enabling & Extending prompts)
Anticipate a common error or misconception		Example questions/prompts you can use to help students who get stuck.
Anticipate an advanced strategy or response		Example questions/prompts that you can use to extend students thinking and deepen their reasoning.
Anticipate the response you expect/want most students to use		Example questions/prompts that will focus students' attentions on the important concepts and help elicit their reasoning.
Things I want to attend to while students are exploring the mathematics: Watch how students are ... Look for students who are ...		
Key mathematical idea(s) to highlight during the summarizing phase(s) of the lesson: What mathematics do you want the students to notice and understand?		
Closing the lesson/revising student thinking	Questions or prompts to get students to reflect on their learning and/or revise their thinking. Students complete statements: "I learnt how to"; "I want to better understand", "Before I thought ... but now I think ..."	
Post-lesson teacher reflection	Something that surprised me during the lesson was What happened that I had not anticipated? What does it reveal about student key understandings of mathematical concepts and processes? What will I change (or keep the same) in this or a subsequent lesson? Why?	

Fig. 6 Lesson protocol to support teacher noticing and learning from teaching.

Conclusion

In the past, teachers have been considered passive participants in teacher professional learning initiatives. Consistent with more recent views of teacher learning, we have portrayed teacher professional learning as an agentic and constructive process in which teachers can seek opportunities for learning in their everyday work. We hope that our proposals surrounding the practices of noticing, the use of learning trajectories and a protocol to support teachers integrate and embed these tools into everyday practice will assist their in-situ learning. While our example of how this might occur and what the process of learning might look like was selective, we hope that what we have proposed will entice other researchers and practitioners to continue systematically exploring the powerful potential teacher noticing can have for sustained teacher learning that is embedded in the complexity of their own classrooms.

Finally, we do not advocate that all teacher learning can or should take place in-situ. A healthy balance of professional learning opportunities centered in and out of the classroom is more likely to be effective and practical than too heavy a focus on just one approach. The important determining element for the choice of an individual teacher's professional learning context should be whether the learning focus and approach aligns with her or his needs.

This article examines the discourse on professional learning by exploring how it is enacted at a school site in Sweden. The term collaborative learning (in Swedish called “collegial learning”, *kollegialt lärande*) was introduced in Sweden by the Swedish National Agency for Education (in Swedish *Skolverket*) in 2010. During the last decade, it has been used as a central term in Swedish reforms of continuing professional development (CPD) as something to strive for and to be fulfilled (Kirsten and Carlbaum 2020). The arguments are based on research on professional learning communities (PLCs) and teacher learning communities (TLCs).

For a better understanding of the study, a contextualization of Swedish policy reforms during the last decade is needed. In 2010, a rewriting of the Swedish Education Act (SFS 2010:800) emphasized a focus on education to be built on research and proven experiences. Along with this, a new career pathway reform for teachers (in Swedish *karriärvägar för lärare*) was established in 2013 (SFS, 2013:70). The reform was legislated by the Government and enacted by the National Agency of Education. It addressed teachers working in schools, with the purpose of creating possibilities for supporting school development and professional learning at the local school (Skolverket 2020). The reform included two possible ways of career paths: (1) teachers studying at university to acquire a Ph.D. exam and to be employed as a lecturer in schools; (2) teachers applying to the responsible authorities to become a “First Teacher” (in Swedish *förstelärare*) at their local school. No academic training is required for being a First Teacher, but certain criteria must be met: being certified as a teacher, having a minimum of four years of educational work in a school, improving student academic outcomes, being interested in developing teachers’ professional learning and being considered appropriate to teach. Both positions are subject to a distinct monthly salary rise (for a lecturer €1000 and for a First Teacher €500). This reform lies well in line with similar global movements in other countries regarding teacher professional standards, e.g., in USA, Australia and Scotland (Hardy and Rönnerman 2018).

In this article we will focus only on the First Teacher and how this part of the reform was enacted in an independent school company, specifically in an upper secondary school. The purpose of this article is to elaborate on how professional learning is organized at a specific school site, and addresses two questions:

- How does a specific school site organize for professional learning through middle leading?
- How does the specific organization of the middle leading practices enable and constrain professional learning among the teachers?

Professional learning – a brief overview

Professional learning has been widely researched globally. During the last decades, there has been a shift in the meaning of this term, from in-service training via professional development to professional learning. While in-service training focused on the

individual teacher, professional learning has a stronger focus on interrelationships with teacher learning, teacher leading and educational change (Edwards-Groves and Rönnerman 2013). Similarly, Timperley (2011) suggests the change in concept from professional development to professional learning, which emphasizes that the teachers have an active role in their own learning.

In contemporary literature, professional learning is also combined in a number of ways with concepts such as collegiality, collaboration, collectivity and community. In a Swedish study, Granberg and Ohlsson (2016) differentiate the terms collegial, collaborative and collective by their different meanings. They argue that collective and collaborative learning has to do with individuals working together to develop mutual knowledge, while collegial learning is more referred to as a method to achieve specific theories or teaching methods to be used individually in the classroom. In the Swedish educational discourse, the concept “collegial learning” was introduced by the Swedish National Agency of Education to be used for national school development programs. The concept is used both as an aim and as a strategy: as an aim to achieve a different culture of learning in schools where teachers collaborate, and as a strategy used in CPD programs with a specific model to promote teacher learning. These programs concern different aspects of educational work, for instance numeracy and literacy. They are structured in a certain way encompassing four steps: (a) individual preparation (reading texts), (b) collegial conversations (discussing content with colleagues and planning a lesson/activity), (c) lesson activity (performing the planned lesson/activity in the classroom) and (d) collegial follow-up (discussing and reflecting on the performed lesson/activity) (Sülau 2019, 106). Within these programs teachers are gathered in groups facilitated by a colleague, who have participated in a short training supplied by the National Agency of Education on how to promote collegial learning (Skolverket 2020). Hardy and Rönnerman (2018) explored how reforms in Sweden have reconstituted teachers’ work. By examining the different reforms following the Education Act, they claim that current reforms reflect neoliberal policy that seek to modify teachers’ practices at a micro level, more than earlier reforms have.

Hargreaves and Fullan (2012) point to the importance of teachers’ professional learning in order to achieve successful student outcomes. They refer to the professional learning that occurs when teachers continuously and collaboratively explore and improve their own teaching. In the same way Timperley (2011) emphasizes the importance of inquiry and argues strongly on using students’ results as the main basis in the teachers’ discussions to be able to learn and develop their teaching. From these perspectives, professional learning is about collaborative action that includes collaborative activities and follow-ups from what is done in practice. Learning might otherwise be limited to the individuals, and the collaborative processes highlighted by Timperley risks getting lost.

In the literature, it is also evident that professional learning is connected to community. Some factors that come through in different studies as important for professional learning communities to be successful, are shared norms and values, collaborative focus on student learning, sharing experiences and dialogues (Fischer, 2013). Some studies even find a relation between PLC’s and student results (McLaughlin and Talbert 2010; Opfer and Pedder 2011). Opfer and Pedder (2011) argue further that teachers learn best when involved in actions together and when these actions are related to everyday activities. Such a community is characterized by collaborative structures and cultures, shared leadership, shared values and visions and collaborative decision-making (Stoll et al. 2006; Nehring and Fitzsimons, 2011). In a recent study, Sülau (2019, 43–46) summarizes six factors for successful professional learning communities, namely purpose and focus, relationships, collaboration, enquiry, leadership and building capacity and support. Most of these factors coincide with other research as presented above, but in this article two are of specific interest: leadership and capacity building in terms of trust.

Leading connected with trust has become more essential in recent times. In Sweden, the two concepts have merged into the concept of “trustbased leading” (in Swedish *tillitsbaserat ledarskap*). This can be seen as a reaction to New Public Management models. Instead of steering toward goal and result, steering by trust focuses on the practices and the need among its participants, where relations are put to the fore. Ståhlkrantz (2021) argues that in the trust-based steering model, every level of decision-making acts to secure the quality of all students’ development and learning. The model strives for collaboration between professionals on a horizontal level to secure collective quality at the same time as it collaborates with the vertical steering chain.

Likewise, Edwards-Groves et al. (2016) show how middle leaders take responsibility for these factors by showing empathy related to trust and confidence to colleagues. A middle leader is in this case a teacher, who most of the time is working in the classroom but also has a role of facilitating learning with colleagues - leading from the middle (Grootenboer et al. 2015). Middle leaders by this definition open up and keep safe places for collaboration and conversations and thereby show togetherness by sharing their practices. Furthermore, a middle leader shows professional knowledge around on-going activities and leads change that is practical, relevant, realistic and reachable. Trust becomes important for this to happen. Jederlund (2019) analyzed school development from the concepts of collegial and collective trust. While “collegial trust is a prerequisite for collaboration, collective trust is a result by collaboration” (Jederlund, 2019, translated from Swedish by the authors, italics in Swedish original). Trust can be strengthened over time, by leaders securing visions and through organizing and supporting collaboration. Jederlund (2019) argues for the importance of organizing and supporting a practice for learning to occur among teachers.

However, as Harris et al. (2019) argue, the term “middle leader” is problematic as one can say there is always a middle leader when you view an organization. They argue that a more diverse set of middle leadership has emerged in the literature (Harris et al., 2019). For example, Fullan (in Harris et al., 2019) defines a middle leader in the regional system as someone having an overall view in the relation between the system goals and the local needs. In the same way Hargreaves and Ainscow (2015) points to middle leaders who are at the district level being the collective drivers of change and development. Harris et al. (2019) also refer to research that underlines how middle leaders have an important role in enhancing students learning. It seems that the term “middle leader” is used at different levels in the school system. Harris et al. (2019) found that research focusing on leadership responsibilities, action and the roles of different middle leaders has increased in the last ten years (Harris et al., 2019, 269).

In this article, we explore the middle leading practice as it is organized at a specific school site and started our work to follow the definition of middle leading from Grootenboer et al. (2015, 524) talking about three characteristics of middle leading as being:

- (1) Positionally – middle leaders are structurally and relationally situated “between” the school senior management and the teaching staff. They are not in a peculiar space of their own, but rather they are practising members of both groups.
- (2) Philosophically – middle leaders practice their leading from the center or alongside their peers. In this sense they are not the “heroic crusader” leading from the front, but rather are alongside and in collaboration with their colleagues.
- (3) In practice – middle leading is a practice and is understood and developed as a practice. To this end, the focus is on the sayings, doings and relatings of leading rather than the characteristics and qualities of middle leadership.

At this site, the middle leading practice unfolds at two levels: in the organization and among the teachers. Our focus is on exploring how the organization of the middle leading practice enables and constrains professional learning. In the following section, we will turn to the site in which this study took place and present its organization followed by a brief introduction to the theory of practice architectures, which is used for analyzing the results. Thereafter, methods used for data collection will be presented followed by the results and conclusions.

Methods and methodology

The site

Frida Education is an independent education company, founded by a few teachers during the “free school reform” (in Swedish *Fris-kolereformen*) that was implemented by the Swedish Government in 1992. The reform aimed at increasing the variety of schools and to create competition between schools by giving students and parents the opportunity to have a free choice of schools. The independent schools were allocated the same resources per student as in the municipal schools. For the teachers who founded Frida Education, the reform made it possible to build a school with a particular focus on the writings in the new curriculum (Lpo 94) about fundamental values and tasks of the school, where concern for the well-being and development of each individual, an equivalent education and student responsibility and influence were among the leading concepts. The vision - *Educating backpackers* - was formed together with some guidelines on how to create a good environment for learning. The guidelines permeate all levels of the company and are the foundation in all activities and relations among the children, students, staff and parents. Some of the key words in the guidelines are: social openness, strong trust, collaboration, flexibility and constant dialogue (Fridaskolan, 2020).

Today, Frida Education consists of different subsidiaries: Frida schools and Didaktikcentrum¹ (explained further down). The company has grown successively since it started in 1993. At the time of the current study, there were Frida schools in five different municipalities in western Sweden, with education from preschool (children from the ages of 1–5) to upper secondary school. About 3500 children and students and 600 employees (teaching staff, service staff and administration) were at this time a part of Frida Education.

When the new career pathway reform for teachers was implemented, Frida Education decided to build a system of First Teachers within the organization. In total, the company was entitled funding for 33 First Teachers; 6 at each elementary school unit and 3 at the upper secondary school. The First Teachers were appointed through an internal application based on the criteria set out in the state directives (especially skilled teachers). The principals at each school unit conducted interviews and decided which teachers should be assigned the commission. The First Teachers at Frida Education have no reduction in working hours, but receive the state grant of €500 as an increased monthly salary premium. 31 of the First Teachers at Frida Education have a 100% employment as teachers at the six different Frida school units. Their commission as a First Teacher is to facilitate professional learning among their colleagues in the current CPD initiative. In this article they are named Facilitators (F).

Two of the First Teachers have a specific commission to work as development leaders (in the text referred to as DL) with a specific responsibility for the company’s internal CPD work. They have a 40% employment at Didaktikcentrum, while the remaining 60% they are employed as teachers at the Frida schools. The Development Leaders are planning and implementing the school board’s decisions of the upcoming two-year CPD cycle. They have a specific responsibility to organize educational meetings (training) on the current professional learning content for the 31 First Teachers acting as facilitators within the organization.

At Didaktikcentrum, a group of people with different competences and responsibilities work with organization and school development issues. There are two researchers with a Ph.D. in Education respective Educational Work, two Development Leaders (DLs) and one person in charge of international projects and relations. In order to lead relevant and important development work, one of Didaktikcentrum’s remits is to keep abreast of current national and global trends in educational research, for example through networking with researchers, politicians and the education community and through canvassing academic literature. Didaktikcentrum conducts an ongoing dialogue with the company board about possible content for upcoming CPD initiatives. The goal is to plan these initiatives about a year in advance before they are enacted in the schools.

Frida Education has a model for change and improvement work, which is known within the organization. CPD initiatives are performed over cycles of at least two years, building on the experience that structural changes and processes take time, and need to be given time in order to create sustainable change in all parts of the organization. The content for the professional learning is decided

¹In 2022, Didaktikcentrum changed names to Frida Professional in order to better describe its focus and purpose. The organisation and the staff as described in the study remains the same.

based on the needs of the local schools, but also on influences by the research and development team at Didaktikcentrum, the National Agency of Education and current educational research literature. Experiences from previous CPD initiatives are taken advantage of, based on how successful they have been in relation to what effects they have generated within the organization. As a part of the company model for change and improvement work, there are also set times for professional learning among the staff. Every Wednesday between 2 p.m. and 4 p.m. is scheduled for all teaching staff to be engaged in educational work conferences. Each principal plan and leads these conferences with a content relevant to the local school. During a school year, 11 of these conferences are predetermined by the company board, and are related to the specific CPD content for the current period. These conferences are to be planned by the principal together with the facilitators at each school, with the support from the development leaders at Didaktikcentrum.

During the school years 2017/18 and 2018/19 the CPD work within the organization focused on *collegial learning*. The purpose of the initiative was described by the school board as “developing a general competence among the staff, which is about trying to understand how to work better together” (Educational Manager) in order to bring about “development and change in the classroom with the students” (Regional Manager). Collegial learning has been part of the company’s idea of how development work should be conducted since its inception, but has not been systematized and organized the way it was during this time period.

The theory of practice architectures

This research focuses on how one national reform, the career pathways (SFS 2013:70), was enacted in an independent school company in western Sweden. We found the theory of practice architectures (TPAs) helpful in understanding how professional learning is being enabled and constrained within an organization (Kemmis et al., 2014). This theory provides a valuable lens for understanding practices (in this case the middle leading) as they happen in real places (like in collegial meetings among teachers or First Teacher meetings). TPA is a site-based theory where the happenings in the practice are in focus. A practice is understood as socially constructed by human beings who come together as individuals in particular sites (like schools or classrooms) and under certain situations and activities (like collegial meetings). A practice consists of *sayings*, *doings* and *relatings* with a specific goal, the project. In many ways, practices are organized around the everyday routines of daily life. Wenger (1998) claims we go in and out of practices all day long. For example, the everyday practices of a teacher can be teaching students in the classroom, meeting with colleagues in the staff-room and joining meetings for professional learning facilitated by a colleague. Because a practice is a social phenomenon based on happenings in the intersubjective spaces between human beings, a practice is never fixed, it is an open question about how things will unfold in real life in real time. Therefore, practices can be understood in routines and predictability, but are prepared for the extraordinary and unexpected at the same time.

A practice is always developed in its local context. In other words, the middle leading practice in the actual organization is situated within a complex of other education practices, and is influenced (both supported and challenged) by these other practices. This means middle leading is mediated, shaped or influenced by the very particular needs of the other individuals with whom middle leaders work (students, colleagues, principals, other administrative staff) and by specific circumstances in the places (or sites) where the middle leading occurs. These specific circumstances are the practice architectures, which inform and are informed by the practice.

The practice architectures consist of three different types of arrangements all enabling and constraining the practice. The *cultural-discursive arrangements* occur in the realm of an intersubjective space where language and thoughts (*sayings*) are used to create shared meanings and mutual understandings about what is being done in the practice. At this specific site, one example is the shared vision and values in the school organization and how they are understood and discussed among teachers. The *economic-material arrangements* occur in the realm of physical space-time where particular activities (*doings*) happen as colleagues meet in shared places in space and time to work with one another and being involved in collaborative activities. In our case, the teachers take part in collegial meetings led by the facilitator at certain times in a specific place. In the same way the facilitators meet each principal to discuss and plan how to continue with the professional learning program. The third type of arrangements, the *social-political arrangements*, occur in social space time where relationships (*relatings*) exist or develop as teachers and facilitators form diverse kinds of collegial relationships through their collaborative meetings. At the site of the current study, the meetings between the teachers and the facilitator can be an activity where power and solidarity is enacted. Therefore, the facilitator needs to be conscious of the roles and the relationships between the teachers so that professional learning is the focus and not the person *per se*.

In actual sites, practices are always influenced by other things that are both local and external, that both enable and constrain what can possibly be done. That is to say, practices of any kind are influenced by conditions, in the theory described as practice architectures. The theory of practice architectures (Kemmis and Grootenboer 2008; Kemmis et al., 2014) lead educators toward a theory of social practice that enables us to consider broader questions concerning the cultural-discursive, material-economic and social-political arrangements (the practice architectures) that shape the practices, for changing educational practices in schools (see Fig. 1).

Kemmis et al. (2014, 6) describe the purpose of the theory of practice architectures as threefold. First, it provides a theoretical language for researchers in sociology and educational sciences to interpret and describe the world. Second, it is a practical tool to use when working with change processes in these scientific fields. In order to change the way a practice come about, one must first identify the specific arrangements that keep it in place. This conclusion leads to the third purpose of the theory, which is to provide a critical perspective toward the relationship between the practice and the practice architectures. By identifying the practice architectures of a practice and how these enable and constrain the practice in reaching its goal (project), it is also possible to be creative in changing these arrangements to be either over won or strengthened.

The *sayings, doings* and *relatings* of a practice are made possible and held in place by *practice architectures*

Fig. 1 How a practice is held in place by its practice architectures. Adapted from Kemmis et al., 2014, 34.

Data collection

The case study in this research is one upper secondary school within an independent school company, Frida Education. It can be considered a unique case in terms of how the school board since the start more than 25 years ago has had a conscious strategy and organization for CPD work, based on the vision *Educating backpackers* (described at www.fridaskolan.se). The vision is grounded in the idea that learning takes place in social interaction, based on communication and relations. This means, among other things, that the work within the school company is organized in teams in all parts of the organization, both within the board and school management as well as among teachers and staff in offices and services. In this study, we explore how this organization is enabling and constraining professional learning, with a specific focus on the middle leading practices. Our main data sources are interviews with persons having leading roles in different parts of the organization. The following people were interviewed:

- The educational manager (EM) at Frida Education
- The regional manager (RM) at Frida Education
- The principal (P) at the upper secondary school (Fridagymnasiet)
- The two first teachers acting as development leaders (DL) at Didaktikcentrum
- The two first teachers acting as facilitators (F) in the upper secondary school

The Educational and the Regional Manager, the principal and the development leaders were interviewed once. The two facilitators were interviewed twice, the first time together and the second time separately. The two researchers (the authors of this article) were both present at most interviews. Exceptions were the interviews with the principal and the development leaders and the second interview with one of the facilitators, when only one of the researchers attended, due to time and distance to the school. Prior to conducting the interviews, the two researchers together worked on the interview schedule. While one of them conducted the interview, the other took notes. All interviews were audio recorded and kept in a safe place.

No interviews were transcribed in full. Based on the notes taken while interviewing and repeatedly listening to the audio recordings, selected data was transcribed and used for analyses and excerpts in the findings. According to the research questions, the focus in this article is on the middle leading practices and how they were enabled and constrained in leading professional learning in the organization.

Findings

In this study, concepts of the theory of practice architectures are used as a lens for analyses (Kemmis et al., 2014). The theory of practice architectures is based on the idea that people meet and understand each other in what Kemmis et al. (2014, 4) call *inter-subjective spaces*. These spaces are always arranged in certain ways; through language, place, time, material things and through social relations. Therefore, how we understand each other and how things happen in a specific practice, is conditioned and prefigured but not determined by these arrangements.

In this study, a point of departure is to illuminate how the “First Teacher” reform in Sweden can be used to create conditions for professional learning. We are specifically focusing on the middle leading practice within an independent school company, to explore how this practice enable and constrain professional learning among teachers. The theory of practice architectures has been used to identify the arrangements that in different ways enable and constrain the project of the middle leading practice, that is to promote professional learning. This makes it possible to draw conclusions on the conditions necessary for the practice to reach its goal, and what changes that might need to come about in order for the practice to work differently.

Organizing for professional learning: A model where two levels of middle leading co-exist

In the first part of the findings, the way that the school company organizes the middle leading practice is presented. The results show that the middle leading practice within the organization is enacted at two levels with different roles and functions; middle leading as managing (development leaders) and middle leading as facilitating (facilitators) (Fig. 2). The interaction between these types is shown in the form of a model (Fig. 3).

Middle leading as managing professional learning

The development leaders within the organization describe their mission as managing the first teachers in their role as facilitators in the collegial groups among the staff. They also support the facilitators in planning school conferences together with the respective principals at the six school units within the company. On eight occasions during one school year, the development leaders meet with the facilitators. On these occasions, seminars and discussions are held about the facilitator’s role in leading professional learning.

In the interviews, the development leaders emphasized that their area of responsibility is only linked to the *structure* of the CPD initiative, that is, the collegial conversations among the teachers. As far as the *content* of the collegial conversations is concerned, it is up to each principal to decide for him/herself based on the needs of the local school. The principals and the facilitators are then expected to plan the professional learning conferences together to unite structure and content in a relevant and functional way.

Within the organization, it is the regional managers who have continuous contact with the principals; they serve as support both in the CPD work and in other parts of the principal’s assignment. The development leaders thus constitute an important support for the regional managers in understanding and communicating the CPD work toward the principals. It is through the meetings with the facilitators that the development leaders are given the opportunity to follow the CPD work, how it is conducted and organized at the various school units.

Middle leading as facilitating professional learning

The facilitators are described by the development leaders as having a significant role in the CPD initiative and for professional learning to be an integral part of the organization. They are in a position between the teachers and the principals in the specific assignment to lead collegial conversations with the teachers.

The two first teachers at the upper secondary school described their mission as facilitating professional learning among their peers. Preparations for this take place at the monthly meetings they have with the development leaders. There is an agenda for the meetings and the facilitators are often given tasks to prepare in advance. It may involve reading some literature and reflecting on the content in relation to one’s own teaching. They also have specific responsibilities for the two joint professional learning days each academic year where all teaching staff within the company participates.

The facilitators suggested that the collegial work in the schools is not a new phenomenon *per se*. Conversation and dialogue are important parts of all conferences and meetings. The difference, the facilitators suggested, is that it now takes place more

Fig. 2 The two middle leading practices within Frida Education.

Fig. 3 The model of the organization of professional learning at Frida Education. (DL, Development leader; EM, Educational Manager; F, Facilitator; P, Principal; RM, Regional Manager).

systematically and in a more structured way. As facilitators, the first teachers are given the opportunity to create a structure in the collegial meeting based on various success factors described in the literature on professional learning.

The two first teachers at the upper secondary school described that they applied for the assignment mainly because they had worked for a number of years within the company and felt a need to take new steps in their careers. They suggested that the assignment as a facilitator gave them the opportunity to be challenged and to take on a greater responsibility. Through the regular meetings with the principals, the facilitators gained greater transparency and participation in the CPD work. Being able to attend and lead conferences and collegial conversations is perceived as a motivating factor. Through the assignment, the facilitators were able to access to new information and knowledge in the meetings with the development leaders, which they also believed developed their personal competence.

Middle leading at different levels

The results show that middle leading within the organization is enacted at two different levels with different assignments and objectives. Some of these are more directed toward managerial tasks, while others are directed toward the practice and the professional learning among teachers. The following model crystallizes:

The model enables and constrains the professional learning practice

The school group's organization of the middle leading practice conditions the way professional learning is and can be enacted in the organization. In this section, the results on how the model enables and constrains professional learning among the teachers are presented.

The middle leading practice in the current school group includes two different levels of middle leading with different assignments and roles (Fig. 2). However, both levels work toward the same goal, or project, to enable professional learning among the teachers. An analysis of the interviews using the theory of practice architectures shows how the middle leading practice is held in place by different arrangements, which enable and constrain this practices in reaching its goal. In this section, the arrangements that are specifically linked to organization are highlighted.

Number of levels/positions - boundary management

The school organization's model for professional learning contains a variety of levels, where different positions are responsible for different staff groups. It provides an opportunity to distribute the workload, but it also requires the different groups to understand the system and have confidence in each other. The term "boundary management" is used by the employees to point out differences between the various positions and assignments. Boundary management, according to the respondents, means that one position should not work with detail-controlled issues that fall within someone else's area of responsibility. At the same time, different positions need to be aware of details in order to be able to organize the work in the best way. In the interviews, it is shown that the balance between governance and information in these boundary managements sometimes constrains the middle leaders' work with professional learning. The development leaders suggested that when the principals have too little knowledge of the professional learning and the content of the meetings with the facilitators, it creates too much room for the principals to pursue the development work in their own direction that does not harmonize with the intended whole. The facilitators also described ending up between two different boundary managements - the development leaders and the principals - where they sometimes had to compromise between the input they received at the facilitator meetings and the output that the principals wanted to address at the conferences.

Scaffolding - to create structures for learning

All groups in the model (Fig. 3) expressed the importance of supporting professional learning with help of different structures. For instance, this meant creating spaces for communication and collaboration, setting agendas for meetings and creating synergies and consistency between the different leading practices. Ultimately, this responsibility lies with the Education Manager at the school board, who says that he is constantly asking himself, "Is it organized well enough to create consistent change?"

An important part of these structures is about anticipation in relation to the commission. Both development leaders and facilitators reported that they needed time to understand the commission (from the school board) in order to read relevant literature and to plan appropriate content in the facilitator meetings and PL conferences respectively. The Regional Manager also emphasized the importance of, in the beginning of the school year, being able to communicate the content for the coming academic years' 11 PL conferences to principals. By having an established structure for CPD initiatives, the principals at the individual school units do not have to spend time creating this structure themselves. However, it also means that time and space must be given to create a common understanding of what is to be achieved and in what way it should be done.

Shared spaces for communication - possibility to calibrate the initiative

A prominent part of the arrangements that stipulate the extent to which the middle leading practices can enable professional learning is about shared spaces for communication. In the model above (Fig. 3), the different spaces for communication are shown in the form of solid and dashed arrows. The solid arrows mark pronounced communication paths between different boundary managements, while the dashed arrows indicate communication paths that implicitly and on a very limited scale, intersect between the different boundary managements. All respondents expressed the importance of increasing these spaces to allow professional learning.

Meetings between the different groups fulfill two functions: firstly, to create opportunities to convey the professional learning content in a similar way, and secondly to be able to calibrate the initiative if any group deviates from the intended content. However, these spaces or meetings do not occur spontaneously, but need to be planned in advance.

Distinctness and stringency in the commission statement

Another important success factor in enabling middle leading practices to promote professional learning is how the CPD initiative is communicated, both in terms of structure and content. All respondents discussed the importance of expectations of the different roles and functions included in the model being clearly stated for the CPD initiative to work. Especially for the middle leading practice, these expectations become evident. The development leaders expressed the importance of the role of the facilitator and his/her commission in relation to the CPD initiative being clearly stated and defined. Should the facilitator act as support for the principal in leading professional learning among teachers or as a catalyst that drives and shapes professional learning at one's own school? Depending on the perspective, the result will be different. It also has consequences for the professional learning in the middle leading practice. When the expectations of the facilitator's role differ in the different school units, it becomes difficult for the development leaders to create a common content for the facilitators. Facilitators also run the risk of being trapped between development leaders' expectations and principals' expectations, which will constrain the professional learning. Thus, it is crucial that the functions and assignments of the first teachers are clearly communicated by the school board at all stages of the organization.

Positive culture of change - trust and confidence

According to the respondents, the organization with facilitators as key persons to support professional learning among the staff is based on a high degree of trust and confidence. Facilitators must be given a mandate to pursue professional learning, both through a formal mandate from the principal and through a more informal mandate from their fellow colleagues. The interviews show that this trust exists in the organization. The Educational Manager stated: "Compared with the investigations and evaluations that are written nationally and in the media about this (the First Teacher reform), there seems to be a relatively high degree of trust among other teachers within Frida Education". One of the facilitators said in the interview: I have received a good response from my

colleagues. They have been positive. It is important that you are accepted by your colleagues, especially since we (Frida Education) strive to be a flat organization where the salaries don't differ too much'. The facilitators also discuss how the trust they have been given in being appointed a First Teacher influence their work. They said: "It also feels important for us that we handle that task [facilitating] and take it seriously. You want to live up to it and feel that it was right that they chose me". Both the facilitators as well as the development leaders and the principal reported that they received positive feedback from the staff, both in terms of the facilitator's role as a leader in professional learning and in the relevance of the content of the CPD initiative. The development leaders highlighted that the culture of the organization is positive as well and that all staff are very active in change work.

The respondents described the teachers' high confidence in the school management and their decision to select a relevant CPD content together with the possibility and ability to adapt the content to the different school units, as a success factor. At the same time, they say, it is a balance between central control and local adaptation. Content that is too general risks being perceived by the teachers as irrelevant, while a local adaptation that is too loose can make it difficult to create a common foundation for professional learning. In this work, the facilitator has an important node for shaping and keeping the professional learning practice in place.

Concluding remarks

The aim of the study was to explore how a specific independent school company has implemented the national career pathway reform to organize professional learning through middle leading. The independent school company in focus for the study has a long history in organizing for professional learning. When a new reform was introduced (career path ways) by the Government, the school company had to find ways to adapt to the new criteria, which meant to find ways to introduce a new professional role - the First Teacher as a facilitator. The Educational Manager emphasized the view that it was important to find a relevant relation between the new role and the existing ideas in the company on how to promote professional learning. Many dialogues were held between the school board and the principals on how to define the role and task of the First Teachers.

Middle leading practice at two levels

As we have shown in this case study, the middle leading practice at Frida Education involves two levels. The organization of the First Teacher reform at the specific site has created two types of First Teachers who coexist in this practice: the development leaders having more of a managerial role and the facilitators leading their colleagues. Both levels form their own practices within the middle leading practice; but are both driven by the same project, to promote professional learning among teachers (Fig. 2). In the literature the concept of middle leading is not clear-cut. Hargreaves and Ainscowe (2015) use it to refer to leaders outside the actual school with more of an administrative role in organizing how to disseminate knowledge in a region. Additionally, Fullan (2015) points to this role as well and emphasizes the necessity of this role getting more concordance in the school system through strengthening the goals and local needs. Grootenboer et al. (2015) use a different definition of middle leading as part of teachers work when facilitating professional learning of others. In this case the middle leader works in a classroom but has an additional task to also lead their colleagues' professional learning. In this study we have observed a third way where middle leading can be viewed as managing and facilitating in the same organization. While the facilitating role match how Grootenboer, Edwards-Groves and Rönnerman define middle leading as closed to the teachers and classroom, the managerial role match Fullan's point on being aware of the school system through goals and local needs.

In the analyses of this study, this became an important outcome in the way the school company had appointed First Teachers at two levels in the organization, where the first teachers as development leaders can be considered middle managers and the first teachers appointed as facilitators are closer to the definition of middle leaders used by Grootenboer et al. (2015). Although acting at different levels in the organization, both practices of middle leading strive for the same goal or project, to promote professional learning among teachers (see Fig. 2). Acknowledging the situatedness of practice (Schatzki, 2002), we do not seek to generalize from our results, but instead put forward an understanding of middle leading as a practice dealing with both managing and leading. This involves for example planning and structuring collegial meetings, using tools and concepts to enhance professional learning, and creating a positive culture of trust among colleagues.

In the literature on middle leading, tension is described connected to the specific role. The middle leader acts at a level between the principal and their colleagues, and is thereby simultaneously handling different practices. Rönnerman et al. (2018) describe these practices as leading and teaching, organizing and facilitating, and cooperating and communicating (see also Grootenboer et al. 2020). In this way, the middle leading practice is conditioned by all these practices and is also enabled and constrained by the practice architectures of these practices. In a review of Bennett (in Harris et al., 2019) middle leaders describe tension connected to the task of leading colleagues. In the current case study, the middle leaders at both levels describe certain tensions that can be connected to their specific role and place in the organization. In the interviews, they talk about these tensions in terms of "expectations" from both leaders as well as colleagues, implicit expectations that the middle leader feels he or she must fulfill. Unlike the middle leaders described in Bennett's review (Harris et al., 2019), the middle leaders at Frida Education don't describe this tension in relation to the task of leading their colleagues. The results show that there is a high level of trust toward the school board, the principals and the middle leaders, which is a probable reason for this.

Trust

Throughout the data, trust with one another and loyalty to the company is obvious. Leaders at all levels in the school company express trust both upward and downward in the hierarchical chain of the organization. Trust is expressed both toward the way different people manage their commission, and to the specific content of the CPD program. [Jederlund \(2019\)](#) claims that trust is a predictor for school development. From the interviews we can see how the respondents talk about a shared vision of the organization that tie the teachers together. One of the development leaders said in the interview: “Despite the fact that we are so many and different school units, we succeed to create and shape what we think is typically ‘Frida’ in all of them”. There is trust to both principals and other leaders in the hierarchy that enable the strategies for the CPD program to be fulfilled. This contributes to the culture where teachers want to collaborate and take responsibility. Furthermore, [Jederlund \(2019\)](#) describes how teachers’ collaboration and collective learning in local CPD is affected by trust on three different kinds: interpersonal relation (collegial trust), in the teacher team (collective trust) and in organizing CPD over time (trust in the process). In another study where a middle leader facilitated teachers, [Edwards-Groves et al. \(2016, 381\)](#) found five dimensions of relational trust, namely interpersonal, interactional, intersubjective, intellectual and pragmatic trust. These dimensions work for CPD that is site based and point out that leading change in schools involves more than just the actual doings. The practice architectures in form of the cultural-discursive, material-economic and social-political arrangements enable and constrain what is happening in the professional learning practice at the school and in the conversations between the development leader and principals and the development leaders and the facilitators. In the school company, there is a chain of regular meetings that enable the leaders and first teachers to stay on track carrying through with the decided CPD content without being hierarchical. In these meetings the conversation goes both ways and develops a shared language on the actual CPD. Relational trust thus seems to be important and from our data we can see that teachers in the middle leading practices (see [Fig. 2](#)) are critical agents for nourishing such a culture in a school and a school company.

The theory of practice architectures - a way of understanding middle leading

In this study, the theory of practice architectures has been used to identify the arrangements that in different ways enable and constrain the project of the middle leading practices, to promote professional learning. The study object has been the way that a specific school company organizes for the middle leading practices. [Harris et al. \(2019, 259\)](#) differentiate between literature related to “middle leader/middle leadership” and “leading from the middle”. The organization of middle leading at Frida education (first teachers acting as development leaders at Didaktikcentrum and first teachers acting as facilitators in the schools) is a conscious strategy to increase capacity and internal cohesion. This can be understood as what both [Grootenboer et al. \(2015\)](#) and [Fullan \(2015\)](#) describes and refers to as “leading from the middle”. In this respect, this study relates to this field, but with a specific focus on the role, practice and behavior of the middle leader, that is a combination of the two perspectives described by [Harris et al. \(2019\)](#). By taking as a starting point the organization of middle leading, and not the middle leader *per se*, this study makes a contribution to the research field as expressed by [Harris et al. \(2019\)](#). It is important to nuance and widen the research on middle leading, since it tends to have a great impact on school through different kinds of reforms. Many studies draw positive conclusions on middle leading, although the empirical base to support these statements is relatively thin, according to [Harris et al. \(2019\)](#). This study tries to answer to this critique by focusing not on middle leading to be implemented in the organization, but on focusing on the organization to understand more about middle leading.

The retention challenge

For nearly two decades there has been no shortage of policy and research attempts to improve the financial and non-financial attractiveness of teaching in response to stubborn teacher supply challenges across the four UK nations (e.g., [European Parliament, 2019](#); [Department for Education, 2020](#); [EPI, 2021a](#); [Worth and Faulkner-Ellis, 2022](#)). However, despite intense investments, almost 40% of newly qualified entrants to teaching in 2009 have left the profession after 10 years ([Department for Education, 2019](#)) and the overall number of teachers has in general failed to keep pace with increasing pupil numbers since 2011 ([House of Commons, 2021](#)). At a time when the UK education system is still stretched by trying to make up for the effects of Covid lockdowns on pupils' learning, the sector is unlikely to be able to recruit its way out of the teacher supply crisis in a foreseeable future.

Investing in teachers' on-going development has been seen by researchers, thinktanks and policy makers as a cost-effective approach to improving teacher retention ([DfE, 2019](#); [EPI, 2020, 2021b,c](#); [RAND, 2021](#); [PBE, 2022](#); [Perry et al., 2022](#)), and leveling up educational opportunities for every child in all parts of the UK ([IOP, 2020](#); [EEF, 2021](#); [HM Government, 2022](#)). However, to date, extensive efforts to improve schools—especially those serving disadvantaged and marginalized communities—by increasing teachers' human capital (i.e., sum of teachers' knowledge, skills, capabilities and dispositions) appear to have failed to bring about the desired result. Examples include the £355 m funds for strategic school improvement and teaching and leadership innovation in England, the four-year Wellcome CPD Challenge to increase the quantity of subject-specific professional development.

The failure of the teacher-centered human capital strategy to transforming teacher quality and reforming schools is not limited to England alone. In the USA for example, [Johnson \(2019\)](#) questioned the lack of success in reaching its goal of improving student achievement and graduation rates of the intense and costly effort of the Bill & Melinda Gates Foundation's six-year, \$575 million intervention to improve human capital in three large urban school districts and four charter management organizations. This and other UK-wide initiatives suffer from a profound conceptual limitation and have struggled to identify sustained impact on improvement: By focusing narrowly on individual teachers' learning entitlements and increasing the total sum of teachers' knowledge, skills and dispositions, these initiatives have largely ignored the integral role of the school organization in teacher retention. Schools are the finders and keepers of teachers ([Johnson, 2004](#)): teachers who excel and whose students excel with them do not just do so on their own ([Day and Gu, 2010, 2014](#); [Day, 2017](#); [Gu et al., 2021](#)). Johnson argues that

Relying exclusively on efforts to improve human capital in this way rests on the shaky assumption that a teacher's success is independent of the school context in which he works, that a teacher who is effective in one school will be equally effective in any other. It is as if the features of schools that teachers regularly report matter to them—for example, the knowledge and skills of the principal, the effectiveness of schoolwide order and discipline, how time is used, whether they have a curriculum and what it is—have no influence on teachers' practice or their ability to successfully educate their students. According to this view, schools are little more than collections of classrooms, each housing a teacher and her students, who work together unaffected by others.

Johnson (2019: 3–4).

Building and sustaining the quality of teachers is not only an agenda for the future ([Day, 2017](#)), but equally importantly, for the wellbeing, learning and achievement of the children who attend schools today. Improving education quality holds the hope of ending learning poverty for the most disadvantaged and marginalized children and young people around the world. For these children especially, school represents an *oasis of safety and hope* where they can learn, play, grow and achieve. Although schools alone

cannot address many of the centuries' old issues of educational and social inequalities that still challenge many children's fundamental right to quality education in modern times, they are spaces where many committed and caring teachers are dedicated to inspiring the learning and achievement of young minds.

The question of how to retain the hearts, minds and effectiveness of teachers who work in intellectually, emotionally and physically challenging places called "school" (Goodlad, 2004) has been contemplated for many years in many countries. In essence, this is a *quality* retention question. In confronting this question, we encounter more fundamental issues of what constitutes teacher quality, why quality retention matters (as opposed to teachers' *physical* retention), and what schools and systems can do to enable them to learn to live new lives in which they are able to sustain their capacity to teach to their best over time.

Why *quality* retention matters

The important role of a high-quality teaching profession in raising standards and transforming educational outcomes cannot be better emphasized in research papers nationally and internationally. Research on teacher effectiveness consistently reports that teachers' classroom practices have the largest effects on student learning and achievement (Rockoff, 2004; Hallinger, 2005; Rivkin et al., 2005; Leithwood et al., 2006). The positive effects of high-quality teaching are especially significant for pupils from socio-economically disadvantaged backgrounds. Evidence suggests that when taught by very effective teachers, pupils can gain an extra year's worth of learning (Hanushek, 1992, 2011; Sutton Trust, 2011). Internationally, comparative research evidence from the Organization for Economic Co-operation and Development (OECD) affirms that "teacher quality" is the single most important school variable influencing student achievement (OECD, 2005). Indeed, its Teaching and Learning International Surveys (TALIS) have repeatedly concluded that making teaching a more attractive and more effective profession must be the priority in all school systems if they are to secure and enhance effective learning (OECD, 2009, 2011, 2018a).

It remains the case, however, for diverse and complex socio-economic and political reasons, that for many countries retaining and developing committed and effective teachers is a real challenge. In many low- and medium-income countries, for example, where school enrollment is on the rise, an acute shortage of primary teachers represents one of the greatest hurdles to providing education for all school-age children (UNESCO, 2011, 2014, 2015). A lack of resources and financial incentive packages to attract qualified personnel into teaching has meant that quantity, rather than quality, continues to be a primary concern in their efforts to provide basic education. This has meant that, unfortunately, children in countries needing teachers the most, tend to be taught by the least qualified personnel (UNESCO, 2006, 2015, 2020).

In contrast, in the world of high-income countries, such as the USA, the UK and many European countries, shortage of teacher supply tends to be a particularly pressing problem for core subject areas such as maths, modern foreign languages and science (European Commission, 2012, 2014; European Parliament, 2019) and for schools serving socioeconomically deprived communities (Ingersoll, 2001; Guarino et al., 2006; Boyd et al., 2008; Allen and McInerney, 2019). There are also troubling indicators which suggest that leadership turnover is especially higher and teacher quality is especially lower in schools serving high-need communities (Loeb et al., 2005; Boyd et al., 2008; Goldhaber and Hansen, 2009; Sibiet, 2020) where most children, who are already disadvantaged in accessing or benefiting from rich capital and social capital in their early years, are then denied access to the quality education to which they are entitled when entering the formal school system.

Retention first, recruitment second

Concerns about teacher supply and quality are not new. Significant falls in the proportion of graduates applying for teacher training programs across many European countries have culminated in an urgent call to increase efforts to transform the conditions of teaching and through this, attract more suitably qualified people to the profession (Auguste et al., 2010; OECD, 2011; European Commission, 2012; European Parliament, 2019). At the same time, the aging population of the existing teaching workforce (Grissmer and Kirby, 1997; Guttman, 2001; Chevalier and Dolton, 2004; OECD, 2005; Matheson, 2007; Aaronson, 2008; European Commission, 2012, 2014) poses pressing challenges to the nature of its composition in the future. Only 7% of all primary and secondary teachers in the EU are under 30 years old, while around more than 1 in 3 (36%) are 50 or older (European Parliament, 2019). In England, for example, close to half of the full-time teachers (46%) are aged over 40, with 19% of these aged over 50 (Department for Education, 2020). This situation is the most pronounced in Italy where more than half of all teachers are older than 50 (European Commission, 2012, 2014; European Parliament, 2019).

Moreover, high rates of attrition of teachers in their first five years of teaching (Darling-Hammond, 1997; Ingersoll, 2003; Kados and Johnson, 2007; Burghes et al., 2009; Shen and Palmer, 2009; OECD, 2005, 2011; Department for Education, 2020) remain a persistent teacher retention problem. Although some studies show that on average, early career leavers tend to be less effective than stayers as measured by the test score gains of the students in their classrooms (Henry et al., 2011; Goldhaber et al., 2011; Boyd et al., 2011), others suggest that teachers with stronger qualifications and more competitive university backgrounds are more likely to exit early (Lankford et al., 2002; Boyd et al., 2005; Guarino et al., 2006; Feng and Sass, 2011).

The reasons behind teachers' decision to leave are complex. A common critique has, at least in part, attributed teacher attrition to a whole-sale redefinition of teacher professionalism driven by "a culture of accountability, performance, and measurability" (Luke, 2011, p. 370; see also Rots and Aelterman, 2008; Smith and Kovacs, 2011). Luke (2011) laments that "the normative, the ethical,

the cultural—matters of value—have quietly slipped from policy discussion (Ladwig, 2010), overridden by a focus on the measurable, the countable, and what can be said to be cost efficient and quality assured” (2011, p. 368). Within such a performativity culture, teacher professionalism has become more closely aligned with national educational policy which tends to define educational success in relatively narrow, instrumental terms (Furlong, 2008). Alongside this, the power of government regulatory bodies for the setting and adjudication of standards has been increased significantly over time. This has been complemented by more detailed and bureaucratic monitoring of what teachers do in their classrooms and how they do it—irrespective of whether what they are required to do is educationally and/or culturally meaningful (Luke, 2011). Thus, whether or not teachers agree with the centrally prescribed policy agendas and strategies, they are expected to conform to them in their day-to-day practice (Furlong, 2008).

It is perhaps, then, no surprise that this highly prescriptive culture of neoliberal accountability and performativity has been criticized by scholars as having contributed to a wide-spread lack of deep trust in teachers’ professional standing, judgment and capability. For some years now, a substantial number of studies on teacher retention have been overly concerned with a narrow problem-focussed agenda. Although this body of research has improved our understanding of the factors which may cause some teachers to struggle and/or exit, it offers rather limited explanation as to why so many other teachers who are working with similar challenges embedded in outcomes driven educational systems are willing, able and committed to continue to teach to their best. What tends to be absent from many of the investigations of teacher stress, attrition and job satisfaction of individual teachers is the integral role that teachers’ professional, role and organizational identities, wellbeing and sense of vocation play in enabling them to meet the daily challenges of teaching and learning (Day and Gu, 2014); and the part played by school leaders in mediating the sometimes negative effects of educational policies and through this, shaping and influencing many, if not all, teachers’ sense of job fulfillment, commitment and effectiveness (Gu et al., 2018).

The positive impact of strong leadership on student learning through building supportive school culture and creating favorable working conditions for teachers is well documented in the teacher development, school improvement and school effectiveness literature (Hallinger, 2005; Johnson, 2004; Leithwood et al., 2004, 2006; Gu et al., 2008; Day et al., 2011; Sammons et al., 2011). Griesom’s (2011) study found that higher teacher turnover rates in disadvantaged schools result in part from the ineffectiveness of the principal. His analysis of national school and teacher surveys showed that teacher satisfaction is likely to be lower, and that the probability for teachers to leave schools is significantly greater when the leadership of the principal is weak and ineffective.

Recent research on scaling up innovations for better teaching and learning outcomes in England also points to the significance of leadership in enabling sustained teacher professional learning, development and change (Gu et al., 2019, 2020, 2021). The research shows that leadership support for professional learning and development is a prerequisite for change in school culture which shapes the intellectual, social and organizational environments that are necessary for change in teacher practice and improvement in pupil engagement in learning. Put simply, “A ‘good’ research-informed innovation can rarely travel into the day-to-day realities of classrooms on its own merits without school leaders that can help teachers engage with it and apply and adapt it to their own classroom contexts” (Gu et al., 2021: 19). In line with these research findings is the observation of the strong and positive associations between school leaders’ administrative support and low teacher retention rates (Ladd, 2009; Boyd et al., 2011). A strong sense of staff collegiality has been found to be crucial in building intellectual, emotional and social capital in schools so that teachers, and especially those working in schools serving socioeconomically deprived communities, are able to maintain their integrity and commitment in times of change (Gu and Day, 2007; Allensworth et al., 2009; Day et al., 2011; Holme and Rangel, 2012).

In his reflection of his leadership journey in education, Sir Dunford (2016) argued that schools and the education system at large should place “retention first” and “recruitment second” in their endeavor to secure an effective workforce to meet the learning entitlements of every student in every school in every country of the world. It would indeed be more fruitful and educationally more meaningful if greater attention were paid to the factors which enable teachers who decide to stay to maintain committed to their own learning and the learning and achievement of their pupils. This is, in essence, a quality retention issue because, as Johnson et al. (2005) have argued, the physical retention of teachers, “in and of itself, is not a worthy goal”:

Students are not served well when a district retains teachers without regard to quality. Little can be achieved (and much might be lost) when a district succeeds in reducing teacher turnover if some of those teachers are incompetent, mediocre, disengaged, or burnt out. Instead, student learning is the goal, and schools must seek to retain teachers who demonstrate that they are skilled and effective in the classroom, are committed to student learning, and are ready and able to contribute to the improvement of their school.

Johnson et al. (2005, p. 2).

However, we all know that to teach at one’s best over time is not easy. In reflecting on her professional work with teachers over the course of her career, Nieto’s (2011) expressed the greatest respect for such teachers: “My belief in teachers is stronger than ever because I have seen the best of them do unbelievable work in sometimes harsh circumstances” (2011, p. 133). These are the teachers who give witness to the essential meaning of “everyday resilience” that Day and Gu (2014) have elaborated in their work on the work, lives and effectiveness of teachers.

Over the years, scholars have used different conceptual and methodological lenses to explore issues around improving the quality of provision of teaching and learning in schools. We have chosen *resilience* in our recent work because it provides a useful conceptual lens for teachers, school leaders and policy makers to understand how and why many teachers have managed to weather the often unpredictable “storm” of school and classroom life (Patterson and Kelleher, 2005) and sustain their commitment and motivation in the profession. It also enables us as researchers to probe deep into teachers’ inner and external professional worlds

to explore why many are able to remain committed and passionate about making a real difference and continue to do so—irrespective of the unpredictable nature of every school and the many physical, emotional and intellectual challenges that are associated with this. More importantly, we know from research that pupils of highly committed and resilient teachers are more likely to perform better academically (Day et al., 2007).

In the remainder of the chapter, I associate teacher quality with the purpose, value and beliefs in teachers' inner worlds which enable them to endure the persistence of hope and endeavor to do their best to reach and engage every student in learning, regardless of the challenges which this may bring. I will do so in the knowledge that teacher quality is not fixed as individuals' capacity to express the conviction of their vocational commitment is almost certain to fluctuate over the course of a career. The extent to which individual teachers are able to exercise their capacity to be committed and resilient will depend not only upon their individual histories and their personal resources, but also upon the influence of the school environment, their colleagues and the quality of their school leadership.

Teacher quality revisited: purpose, value and beliefs at the core

There is strong and consistent research evidence that teachers' classroom practices have the largest effects on student learning achievement (Rockoff, 2004; Hallinger, 2005; Rivkin et al., 2005; Leithwood et al., 2006; Barber and Mourshed, 2007; Mourshed et al., 2010; Leithwood, 2019). At the systems level, the two McKinsey's reports (Barber and Mourshed, 2007; Mourshed et al., 2010) show that getting the right people into the teaching profession and developing them to become effective teachers have played a central role in enabling the world's most improved school systems to come out on top, and more importantly, keep getting better. Put simply, teacher quality is the most critical school-level and system-level predictor of student success.

Depending on the theoretical and methodological interests and preferences of educational researchers, the definitions and measures of teacher quality vary considerably. At times, the meaning of *teacher* quality is used interchangeably with that of *teaching* quality. For example, in some studies where the research focus was on investigating increases in the quality of teaching, value-added scores and learning gains were used to measure and categorize the quality of teachers rather than what they do in the classroom (e.g., Chetty et al., 2014; Bowen and Mills, 2017).

It is necessary to make a distinction between teacher quality and teaching quality because, as Kennedy (2010) argues, "the qualities teachers bring with them to their work are not always enough to ensure better teaching practices" (2010: 591). A profound difference is that the former is essentially concerned about the person in the professional teacher, while the latter is about the practice of the professional. Put differently, teacher quality concerns *who the teacher is*, *what being a teacher means to the person*, and *what the values, capacity and, capabilities they have* that influence, positively or negatively, student learning and achievement. In contrast, teaching quality is primarily concerned with *what the teacher does in the classroom* (i.e., processes and activities of instruction) and *how well they do it* (i.e., impact of instruction on student learning). Thus, quality teaching as against quality teachers will be influenced, as Kennedy (2010) reminds us, not only by the "enduring personal qualities that they bring with them" but will also be "a function of schedules, materials, students, institutional incursions into the classroom, and the persistent clutter of reforms that teachers must accommodate" (2010: 597).

Teacher quality has remained central to policy debate about teacher supply and demand in many countries. This is because, at least in part, teacher quality attends to the ethical and vocational values, passion and resilience, as well as cognitive, social and psychological resources and dispositions of the person *in* the teacher—all of which influence, powerfully and profoundly, teachers' capacity to teach well over the course of their professional lives. Their commitment, enthusiasm and resilience—qualities that are harder to measure—are fundamental to how teachers feel about their work, how they think about themselves as professionals, and importantly, how they are (or are not) able to fulfill their professional values and core purposes by making a real difference to children's learning and achievement.

In this chapter, I focus on two inner resources of teacher quality: *altruistic values* and *efficacious beliefs*. The reasons are twofold. First, these inner resources are expressions of the personal values and strengths of the *person* in the professional teacher that define the ethical character and professional quality of the teacher. Second, and related to the first, they enthuse and enable teachers to improve their capabilities to fulfill the personal and social meaning of teaching, and therefore explain *why* some can "maintain equilibrium and a sense of commitment and agency in the everyday worlds in which teachers teach" (Gu and Day, 2013, p. 26) while others cannot.

Purpose and values: the soulfulness of quality

In his seminal work on teaching as a calling and vocation, Hansen (1995, 2021) argues persuasively that the idea of vocation underscores the fact that it is not the teaching *role* itself but "the person within the role and who shapes it who teaches students" (1995: 17). In describing teaching a calling and vocation, Hansen invites us to probe deeply into understanding the soulfulness and passion in teaching as well as the social origins of the *practice* of teaching which embodies teachers' esthetic (e.g., having a feeling and a sense for work done well), moral, and intellectual endeavors and inspirations to enact their inner urge to make a difference to the learning and achievement of their students. The language of vocation takes us *inward* to recognize that when the person is called to "*be* a teacher rather than just to *do* or *perform* a job that others might easily accomplish in their place (Sherman, 2013, 2020)"

(Hansen, 2021: 23), we see the identity of the person in the teacher and get closer to understand why for many teachers, teaching is much larger than a job.

The sense of vocation finds its expression at the crossroads of public service and personal fulfilment. It takes shape through involvement in work that has social meaning and value. ... Vocation is also expressed over time. ... a person cannot will a sense of service into existence nor wake up one day and decide to be of service. Those dispositions grow and take shape over time, through interaction with people and through the attempt to perform the work well.

Hansen (2021: 3–4).

What follows is that the person's altruistic values and principles shape the ways in which they derive the social, intellectual and moral meanings from their role as a teacher. Recognizing how these inner meanings motivate teachers to improve their ability to teach well is integral to understanding why the teaching profession is regarded by many committed and dedicated teachers as a "life-style" (Day and Gu, 2014).

Altruism as a philosophical concept has long been used in education to describe an ethical principle and moral purpose that drive many teachers to build caring relationships with their students (Nias, 1989; Noddings, 1992), and remain committed and passionate about giving their best to the students whom they serve (Ayers, 2010; Day, 2004; Gu and Li, 2013; Hansen, 1995; Nieto, 2003, 2015). Altruistic principles and values are internal to the calling that has drawn many teachers into the practice of teaching. However, to view teaching as an "altruistic vocation" (Schwarz and Alberts, 1998: 155) is not, as skeptics might argue, an unsustainable "ethical ideal" which requires teachers to sacrifice a high degree of selflessness (e.g., Higgins, 2011). Nor does it deny that teachers' material needs (such as pay and income) are important. Our research on teachers' subjective wellbeing in China shows that teachers' altruistic values have no direct associations with their income satisfaction, but positive and direct associations with their satisfaction with work (Song et al., 2020). When teachers' salaries have met the "basic threshold" of income, those with stronger altruistic values and higher efficacious beliefs tend to report smaller effects of income on their work satisfaction.

Over the last decade evidence from our own research in England and China and international surveys of teachers (OECD, 2014, 2018b) repeatedly shows that the majority of teachers in the profession are still hopeful, committed and passionate about making a difference to the learning and lives of the children—for whom they care and feel responsible. Bullough and Pinnegar (2009) argue that it is in moments when teachers were meeting their ethical obligations to children that they felt elevated and were reminded of why they were first "called to teach" (2009: 246).

Therefore, in our analysis of teachers' work and lives, we consider altruism as the essence of teachers' ethical values, principles and obligations, which according to Hansen (1995), enable them to see work as a "service to others" and gain "personal satisfaction in the rendering of that service" (1995, p. 3). This view "turns the focus of perception in such a way that the challenges and the complexity in teaching become sources of interest in the work, rather than barriers or frustrating obstacles to overcome" (Hansen, 1995: 144). Such a view of teaching leads to a positive and productive emphasis on learning, growth and development—which regards teachers' need for intellectual challenge and capacity building as an indispensable part of their moral responsibility. It reveals profoundly that the good life of teaching entails both an *intellectual* act and a *moral* enterprise (Huberman, 1993; Palmer, 2007; Day and Gu, 2010, 2014; Goodlad et al., 1990; Hansen, 2021). It is this inner meaningfulness—intellectually, emotionally and spiritually—that influences, deeply and powerfully, teachers' own sense of identity and wellbeing.

Becoming a wonderful teacher, or a great or awesome teacher, is a lifetime affair. This is because good teaching is forever pursuing better teaching; it is always dynamic and in motion, always growing, learning, developing, searching for a better way. Teaching is never finished, never still, never easily summed up. "Wonderful Teacher" might be inscribed on someone's lifetime achievement award, printed on a retirement party banner, or etched on a tombstone, but it is never right for a working teacher.

Ayers (2010: p. 16).

From the perspective of social change and evolution, Welzel and Inglehart's (2010) seminal work on values and wellbeing reminds us of the importance of considering the social markers and cultural sources of values when investigating teachers' internal worlds. This is because "humans internalize most of their values fully unconsciously in an unquestioned process of socialization"—through which they are "familiarized with what is socially accepted in their society" (Welzel and Inglehart, 2010, p. 47). For example, in the Chinese culture and society where the self is viewed as "a connected, fluid, flexible, and committed being who is bound to others" (Lu, 2010, p. 335), and where the prevalent Confucian moral discourse has long stressed the importance of suppressing selfish desires to serve the collective, the origins of Chinese teachers' sense of purpose and meaningfulness as well as intellectual and social connections in their worlds of work reside not only in their personal motives and goals, but more profoundly, the fulfillment of their moral obligations as a professional for the society. In this sense, Chinese teachers' satisfaction with the quality of their professional lives encapsulates the attainment of purpose and goals that meet both their own intrinsic professional needs and those of the larger professional community and society—to which they belong. The identification of culture-specific values in shaping Chinese teachers' perceptions of the meaning and goals of their work highlights the need for a deep understanding of *what matters to whom* and *in what contexts* in future research on teachers and teaching.

Efficacious beliefs: psychological functioning that enhances quality

Bandura's (1986) social cognitive theory defines perceived self-efficacy as individuals' beliefs about their capabilities to exercise control over events that affect their lives, to produce expected performance, and to influence others. People with strong beliefs in their capabilities make things happen by setting themselves challenging goals, thinking strategically in the face of difficulties, and remaining resilient, motivated and task-focused (Bandura, 1997). Bandura (1997) thus rejects the view that efficacy beliefs are mere inert predictors of performance accomplishment. Rather, he argues that they are "a vital personal resource" (2000: 120) which function as a key contributor to effective functioning and human flourishing.

When faced with obstacles, setbacks, and failures, those who doubt their capabilities slacken their efforts, give up, or settle for mediocre solutions. Those who have a strong belief in their capabilities redouble their effort to master the challenges.

Bandura (2000: 120).

Bandura's argument, together with findings from the latest research on teachers' self-efficacy (e.g., Klassen et al., 2011; Renshaw et al., 2015; Zee and Koomen, 2016), offers conceptual and empirical ground for the argument that teachers' efficacy beliefs are their self-referent judgments of their own capacity and capability to perform at certain levels (Kelley and Finnigan, 2003; Zee and Koomen, 2016). Over the last thirty years research has consistently reported that self-efficacious teachers tend to suffer less emotional exhaustion and burnout symptoms, and experience more confidence in mastering challenging tasks and higher levels of responsibility for teaching, commitment, personal accomplishment, and job satisfaction (e.g., Klassen and Chiu, 2010; Pillay et al., 2005; Skaalvik and Skaalvik, 2010; Schwerdtfeger et al., 2008; Zee and Koomen, 2016; Song et al., 2020). These findings lend support for the view that the strengths of teachers' judgments of their performance capability enhance, or constrain, the strengths of their aspiration, commitment, and effort to fulfill different task demands in given circumstances and through these, influence, positively or negatively, their emotional outlook and satisfaction with the quality of their work and life.

Values and efficacious beliefs are both key aspects of psychological functioning (OECD, 2013). Our recent research on teachers' wellbeing (Song et al., 2020) offers additional evidence emphasizing the importance of psychological functioning in explaining human flourishing (see also, Diener et al., 2010; OECD, 2013). Although strong altruistic values can fulfill teachers' satisfaction of "becoming the kind of teacher and person they desire to be," (Bullough and Pinnegar, 2009, p. 246), the enactment and fulfillment of these values is mediated by their efficacious beliefs. On the one hand, purpose and meaning, as "powerful regulators of human behavior" (Welzel and Inglehart, 2010, p. 47), empowers (or limits) individuals' efficacious beliefs in their capacity to perform proficiently in context. On the other hand, teachers need to feel efficacious in what they do in order for there to be a positive effect on work satisfaction from their strong values. Put another way, only when teachers' care and love for students are enacted in ways which enable them to master the challenges and thus continue to teach to their best can they experience higher levels of satisfaction with the quality of their work as a teacher.

Developing teacher quality: why schools matter

A social ecological approach to researching teacher quality

Over the years, we have worked with teachers also who, despite their hard work, commitment, moral purpose and dedication to the education of their students, struggle to improve outcomes. Those teachers who excel and whose students excel with them do not just do so on their own. While it is clearly the responsibility of each teacher to teach to their best, it is the responsibility of each individual school, school district and national government to ensure that they are able to do so through high-quality leadership and the provision of physical and other resources. Strong and consistent evidence from educational research suggests that the social and intellectual organization of the school, and by extension, schools' connections with local communities, society, and the policy structure—when characterized with supportive and trusting relationships between different stakeholders—fosters teachers' collective capacity, commitment, resilience and effectiveness (Bryk and Schneider, 2002; Day and Gu, 2010, 2014; Sammons et al., 2007; Tschannen-Moran and Barr, 2004).

Such evidence invites us to use a social-ecological approach to analyze how the environments in which teachers work and live influence, and are influenced by, their capacity to teach well over the course of their professional lives. The relevance of the social-ecological approach to researching teachers' quality are at least threefold.

First, an *environment-centered approach* to human development reinforces the importance of emphasizing the impact of multilevel contexts on the growth of teachers over the course of their professional lives, especially in terms of their capacity to maintain a sense of commitment and agency in the everyday worlds in which they teach. The theoretical underpinning of the social ecology of teachers' work, lives and professional development emerged from Bronfenbrenner's (1979) ground-breaking work on human development which is, in essence, concerned with the interconnectedness and interactions between multilevel systems and the ways they shape the course of human development throughout the life span. Bronfenbrenner defined human development as "the person's evolving conception of the ecological environment, and is relation to it, as well as the person's growing capacity to discover, sustain, or later its properties" (1979, p. 9).

The same argument applies to teacher development. The quality of the reciprocating systems in education influences the quality of the intellectual, social and organizational conditions in which teachers work—which in turn impact, positively or negatively, on their professional identities and their capacity to be committed, efficacious and effective (Belman, 2015; Day and Hong, 2016; Gu, 2014; Gu and Day, 2007, 2013; Johnson et al., 2016). Among these, the environments of schools are found to be particularly significant in shaping why and how many teachers are able to continue to commit their time, energy and passion to a profession which can make them “feel a sense of invisibility and powerlessness” (Nieto, 2015, p. 252; see also Gu and Johansson, 2013; Johnson, 2004; OECD, 2016; UNESCO, 2015). I will unpack why schools and school leadership especially, matter to teacher development and teacher quality in more detail later.

Second and related to the first, the social ecological model of person $\times$ environment interaction (Ungar et al., 2013) enables us to place teachers in their complex worlds of work and analyze the ways in which their capacity to teach to their best *influences* and is *influenced* by their professional worlds. Unlike children whose individual resources (e.g., optimism and efficacy) are believed to be “only as good as the capacity of his or her social and physical ecologies that facilitate their expression and application to developmental tasks” (Ungar, 2011: 6), teachers are “moral and political agents” (Soder, 2004: 11) whose moral values form the hub of a school’s culture which energize teachers’ collaboration, learning and development. For teachers, if their role expectations were primarily defined by prescribed standards, methods and techniques, then these expectations would have missed a simple but fundamental truth about “a good teacher”:

Good teachers possess a capacity for connectedness. They are able to weave a complex web of connections among themselves, their subjects and their students so that students can learn to weave a world for themselves. ... The connections made by good teachers are held not in their methods but in their hearts—meaning heart in its ancient sense, as the place where intellect and emotion and spirit and will converge in the human self.

Palmer (2007: 11).

The voice of the *heart* flows from the identity and integrity of the inward teacher (Palmer, 2007) and speaks out why many teachers in many countries regard teaching as “a way to live in the world” (Nieto, 2015, p. 1). As I have elaborated earlier in this chapter, understanding the role of moral values and vocation in influencing what many teachers do and why they do it in their schools and classrooms is key to understand the dynamic and complex nature of the interaction between the teacher and their context of work. Deal and Peterson (2009) argue that “like a butterfly, a school must be nurtured by its inner energy in order to thrive” (2009: 180). This reinforces the observation that teachers’ actions, commitment and beliefs also influence, individually and collectively, the social and organizational culture and contexts in which they work and live. Buchanan (2015) found in her research on teacher identity and agency that the discourse of education policy and structures do not completely redefine teachers’ self-concepts: “Teachers are more complex and multifaceted than that” because individual teachers bring with them “a unique mix of personal and professional experiences and commitments” (Buchanan, 2015: 700):

Teachers therefore confront the policies and professional discourses they encounter not as *tabulae rasae*, but rather actively use their own preexisting identities to interpret, learn from, evaluate, and appropriate the new conditions of their work in schools and classrooms. In this process, their identities are reformed and remade—and professional agency is carved out.

Buchanan (2015: 700).

Last but not least, the social ecological understanding of teachers’ work and lives emphasizes a *process-oriented, developmental-contextual* approach to viewing and supporting teacher development. Teacher quality, or put differently, teachers’ capacity to develop and sustain their qualities to teach well is nurtured, learned and acquired in their context of work. Over time such capacity unfolds progressively in a developing individual (Schoon, 2012) as they learn to navigate and negotiate their way to the intellectual, social/relational and technical resources in their immediate external environment that enable them to continue to learn, to grow, and to enact their values and capacity to teach well. For many teachers who have managed to sustain their commitment and motivation in the profession, the ability to weather the often unpredictable “storm” of school and classroom life (Patterson and Kelleher, 2005) is not an option, but a necessity. Sustained pursuit of continuing professional learning and development is what makes good teachers and great teaching. This is a career-long moral commitment and “a sustainable investment for professional capital” (Hargreaves and Fullan, 2012: 186).

Why schools matter in developing and sustaining teacher quality

The conceptual strengths of the social ecological approach to researching teachers’ work and lives highlight the significance of schools as “finders and keepers” (Johnson, 2004) of committed, resilient and quality teachers. Despite the reform and societal pressures on teachers, research consistently shows that three interrelated conditions—teachers’ vocational selves, social and professional relationships with colleagues, and leadership support and recognition—are found to be integral in enabling them to sustain their educational purposes and successfully manage the “unavoidable uncertainty” (Shulman, 1987, p. 1) inherent in the everyday life of a teacher (Gu and Day, 2013). Among the three, school leadership comes first and acts as a necessary organizational condition that enables teachers to fulfill their professional commitments in collaboration and partnership with their colleagues.

Recent research evidence on teacher retention shows that teacher leavers are not necessarily “escaping” from pupils’ poor behavior. Rather, they are escaping from poor leadership and dysfunctional school cultures. Toxic cultures devalue our need of others, impede our ability to turn to them for support, and challenge our capacity to form supportive and collegial relationships to learn and develop (Jordon, 2006, 2012). At a result, with a heavy heart, we continue to observe in our research that some teachers seeing teaching behind closed doors as a reality of the profession. Many of these teachers, more often than not, have struggled to understand why their sheer hard work has failed to bring about the levels of progress and achievement that they would like to see in their students (Matthews et al., 2014).

Our decades of research on school leadership and school improvement shows that principal leadership is instrumental in bringing about improved learning outcomes in schools. They contribute to student learning largely *indirectly* through leadership activities and influence, particularly through building school capacity and (re)designing structural, sociocultural, and relational processes that are conducive to promoting professional learning communities and raising the quality of teaching and learning (Bryk et al., 2010; Day et al., 2011; Gu and Johansson, 2013; Hallinger and Heck, 2010a,b; Leithwood et al., 2010, 2017; Sun and Leithwood, 2012, 2015). The quality and professional capability of leadership also defines the extent to which individual schools are to be engaged with externally initiated improvement effort and the ways in which the new learning is to be aligned with, as well as advance, the existing culture and capacity for change and sustained improvement.

In this process, school leaders, and school principals especially, are the *architects* of social relations and learning cultures in their schools. Their ability to drive professional development and improvement in their own schools (leader self-efficacy) and to develop sustained collaboration with other leaders and schools (leader collective efficacy) shapes the *base* capacity to be engaged with improvement initiatives within local school systems and “the *new* capacities that must be developed to sustain and extend these initial efforts over time” (Bryk et al., 2010, p. 220, italics in original; also Leithwood and Louis, 2012). It is perhaps then no surprise that in high-performing schools a key defining aspect of principal leadership is an unrelenting focus on fostering consistent values, expectations, and standards, and through these, empowering and transforming staff capacities and organizational conditions to embrace change and improvement.

Concluding remarks

A central task for all concerned with enhancing quality and standards in schools is, therefore, not only to have a better understanding of what influences teachers’ quality over the course of a career, but also the means by which the teacher quality necessary for these to be sustained may be nurtured in the contexts in which they work. Promoting and cultivating healthy individual and collective learning and achievement cultures in schools is essential to how they feel about themselves as professionals.

Establishing consistency and coherence in school structures, cultures, and improvement processes holds the key to engaging the heads, hearts and hands of the school community to achieve sustained and sustainable performance over time. Such consistency and coherence were reflected in understandings—between those who led and those who were led—of how and why their schools were able to become successful and, as importantly, to stay successful. They helped to shape the day-to-day practice of school life and enabled schools in our research to remain focused on the core business of schools—quality provision of teaching and learning—irrespective of external pressures of change (Gu et al., 2018).

The literature on formally structured professional learning opportunities for in-service teachers has continued to grow steadily over the past decade. In our article on contemporary approaches to professional development (PD) in the International Encyclopedia of Education ten years ago, we examined the content and processes commonly seen in high quality professional development (Borko et al., 2010). Since that time, a steadily growing body of research has confirmed the importance of the characteristics of effective PD that we highlighted: situated in practice, focused on student learning, models preferred instructional practice, active teacher inquiry, collaborative learning communities, located in appropriate settings, and sustained over time (c.f., Asterhan and Lefstein, 2020; Lefstein et al., 2020; Bautista et al., 2017; Darling et al., 2017; Desimore and Garet, 2015; Hubers et al., 2020).

There continues to be a widespread effort within the international research community - across content areas and topics of interest - to carefully consider how to support teachers' on-going professional development (c.f. Bautista and Ortega-Ruiz, 2015; Kennedy, 2016; Lieberman and Mace, 2010). There is agreement that teachers can benefit from engaging in opportunities to study and reflect on instructional practices, student learning, and the broader educational context. To this end, intentionally organized structures (such as practice-based learning and online learning environments) and domain expertise (such as knowledgeable facilitators and coaches) are critical elements. There is also a growing recognition of the importance of centering teacher learning around issues of equity and supporting diverse students.

In our earlier article we provided examples of PD efforts within each of three research phases, as delineated by Borko (2004), noting that most research on teacher professional learning prior to 2010 could be classified as Phase 1 or proof-of-concept studies. Since that time, other researchers have showcased the large increase in Phase 2 (single program/multiple sites) and 3 studies (multiple programs and multiple sites), particularly in the area of mathematics education (Karsenty and Arcavi, 2017; Santagata et al., 2019; Sztajn et al., 2017). Therefore, in this article, we move beyond describing and cataloging PD efforts and instead shift our focus to several of the most salient and innovative topics in PD literature since 2010. Our intention is to highlight trends and unresolved issues within and across these topics, to showcase how the field has matured, and to spotlight issues that are likely to become increasingly relevant over the next decade.

Thousands of journal articles, monographs, books, and dissertations are published about PD each year, as well as numerous reviews of this literature. This article is not intended to serve as another review, but rather as a vehicle to consider a small number of topics that have emerged, in our view, as taking on critical importance in the field over the past decade. To determine which topics

to focus on, we primarily considered existing literature reviews, syntheses, meta-analyses, and research studies pertaining to PD that were published from 2010 to 2020. Our reading of the literature was not exhaustive, but rather in pursuit of our goal to select a set of topics for inclusion in this article. Ultimately, we arrived at the following four topics: (1) practice-based professional development; (2) online professional learning; (3) facilitation of professional development, and (4) PD focused on supporting diverse learners. Within each topic this article highlights active areas of investigation and selected research findings, and identifies questions yet to be answered.

We elected to include these four topics due to their importance as trending issues in the field, meaning that there exists a substantive body of literature that has been built up over the past decade (or longer), and because we anticipate that they will be critical topics in the field going forward. Just as context influences decisions about professional learning experiences, it informed our decisions when writing this article. Thus, we would like to acknowledge the fact that this article was written at the height of the COVID-19 pandemic by an authorship team based in the United States. The pandemic has had a profound and enduring effect on teaching and professional learning (Ferdig et al., 2020; Hartshorne et al., 2020; Minkos and Gelbar, 2021), in particular by centering the importance of online tools for both students and educators. Also critical is that the article was written as the Black Lives Matter movement (Garza, 2014) gained prominence in the United States and other countries. This grass roots movement served to highlight the systemic injustices perpetrated against people of color, drawing the attention of both teachers and researchers to critical issues around race, equity, and social justice (Mayorga and Picower, 2018). These historical events contributed to our selection of topics to address in this article, and motivated our thinking about the topics that are likely to be particularly relevant in the decade ahead.

Trend: practice-based professional development

Over the past decade practice-based PD has become increasingly popular as a way to organize teachers' professional learning, highlighting classroom instruction and students' learning. This trend comes as the primary focus of teacher education has shifted from specifying the knowledge necessary for teaching to supporting teachers in becoming more reflective about the everyday practice of teaching (McDonald et al., 2013; Sztajn et al., 2020). As the National Academies of Sciences, Engineering and Medicine (2020) documented in their recent report on teachers and teacher education over the last 20 years, "advances in PD practice and research have been prominently marked by the potential for teachers' learning in and from practice" (p. 6).

Practice-based PD situates professional learning opportunities in the central activities of teaching (Ball and Cohen, 1999) and supports teachers to "develop or enhance skills by connecting them to current classroom practices" (Hirsch et al., 2020, p. 2). Although many PD models employ practice-based approaches, they are most commonly incorporated into ongoing or iterative models such as plan-do-study-act continuous improvement cycles (Bryk et al., 2015; Lewis, 2015), lesson study (Lewis and Perry, 2017) and the Problem-Solving Cycle/Dialogic Video Cycle (Borko et al., 2015; Gröschner et al., 2015; Borko et al., 2017).

The variety of approaches to practice-based PD highlights the creativity of both teachers and PD designers as they explore new avenues for teachers to attend to specific aspects of their practice. In this section we focus on two of these approaches: (1) examining artifacts of practice during PD, and (2) collaboratively designing instructional materials during PD.

Artifacts of practice

Classroom artifacts of practice are physical records that capture aspects of the work that happens during lessons such as video of classroom discussions, samples of students' written work, and transcripts of students' small-group problem solving (Goldsmith and Seago, 2013). During professional development, classroom artifacts provide a common point of reference to anchor teachers' collaboration and community development and to focus their discussions on content, learning, and teaching (Roth et al., 2011). Recent research has sought to understand how bringing artifacts of practice into PD can offer authentic and rich learning experiences for teachers, as well as how teachers can be supported to meaningfully engage with those artifacts (Jilk, 2016). For example, there is an emerging body of literature on what teachers notice when they attend to artifacts of practice during professional learning workshops (Dreher and Kuntz, 2015; Jilk, 2016; Santagata and Yeh, 2014; Sherin and van Es, 2009). The concept of teacher noticing includes both what teachers observe and how they make sense of teaching and learning as they interact with artifacts of practice (Sherin et al., 2011). Van Es (2011) developed a framework for learning to notice student thinking, which she found to be a useful tool for scaffolding teacher learning.

Video is perhaps the most commonly used and studied artifact of practice in the current literature on practice-based PD. Several recent, comprehensive literature reviews highlight the substantial promise of video-based PD (Gaudin and Chaliès, 2015; Major and Watson, 2018; Marsh and Mitchell, 2014; Tripp and Rich, 2012). These reviews conclude that video is a powerful and effective tool to promote improvements in teaching practice. Furthermore, video-based PD has the potential to enhance teacher cognition and, in some cases, impact student learning outcomes. A number of reports offer guidance on designing PD that integrates video as part of the learning environment (Blomberg et al., 2013; Roth et al., 2017; van Es et al., 2019).

A wide range of professional development models, including both adaptive and specified programs, make use of video to encourage teacher inquiry into their practice, either through individual or collective reflection (Borko et al., 2011b; Koellner and Jacobs, 2015). Adaptive models derive learning goals and resources from the local context and shared video is generally from the classroom of one of the participating teachers. Well-researched adaptive programs that incorporate video include video clubs

(Luna and Sherin, 2017; Sherin et al., 2009), instructional coaching (Desimone and Pack, 2017), and the Problem-Solving Cycle/Dialogic Video Cycle (Borko et al., 2015; Gröschner et al., 2015). Specified programs that incorporate video often provide published materials that specify teacher learning goals and include pre-selected resources, tasks and video clips. Well-researched specified programs that incorporate video include Cognitively Guided Instruction (Carpenter et al., 1989), Learning and Teaching Linear Functions (Seago et al., 2004), and Learning and Teaching Geometry (Seago et al., 2017). Science Teachers Learning through Lesson Analysis (STeLLA) is a well-researched program using video that incorporates both specified and adaptive components (Taylor et al., 2017; Roth et al., 2019).

Video can be used to encourage teacher inquiry into their own instructional practice or the practice of their colleagues or unknown teachers. In general, watching video from their own or other teachers' classrooms has proven beneficial for teacher learning. There is evidence for the positive benefits of both approaches and at present there is not a consensus as to which is best (Beisiegel et al., 2018; Gaudin and Chaliès, 2015; Kleinknecht and Schneider, 2013; Seidel et al., 2011). For example, Seidel et al. (2011) found that when teachers analyze their own videos versus other teachers' videos they had higher engagement and noticed more relevant aspects of teaching and learning, however they were less self-reflective. In contrast, Kleinknecht and Schneider (2013) reported that teachers' emotional and motivational engagement was higher when they viewed video of unknown teachers versus their own teaching. Based on the studies they reviewed, Gaudin and Chaliès (2015) cautioned that video of other teachers can seem removed from teachers' own classrooms and recommended that the educational context in which the video was made be described when video of other teachers is used.

Co-design of instructional resources

Practice-based PD often involves the study and reflection on classroom instruction that has already taken place. However, it can also include learning activities that prepare teachers for future classroom routines and practices. One example of a future-oriented, practice-based activity that can be brought into PD settings is the collaborative development of instructional resources (Voogt et al., 2015). Collaborative design or "co-design" refers to the active participation of teachers in the generation of educational materials or innovations. Similar to the arguments for using artifacts of practice as a tool for teacher learning, co-designing (or re-designing or co-adapting) curriculum and other instructional resources situates teachers' involvement in the learning process as directly meaningful to their everyday practice (Voogt et al., 2011).

Co-design can occur within a variety of formats that intentionally foster a design community in which teachers share knowledge and perspectives, with the aim of generating a resource to support student learning. For example, co-design can be part of iterative inquiry cycles such as lesson study (Wake et al., 2016), and research-practice partnerships that are organized around solving educational problems of practice (Penuel, 2019). Co-design projects fall on a spectrum that ranges from a primary focus on teacher professional learning (such as lesson study, in which teachers collaboratively develop exemplar lessons; Huang et al., 2016; Huang and Shimizu, 2016) to a primary focus on product development (such as producing innovative curricular materials; Gueudet et al., 2016). However, even when the focus is solidly on product development, the participating teachers are engaging in professional learning (Westbroek et al., 2019). By contributing their expertise to the design of resources that will be used in practice, co-design has been demonstrated to have a number of positive impacts on teachers - including an impact on their knowledge (Voogt et al., 2016), perceptions of agency (Severance et al., 2016), and their instruction (Voogt et al., 2016).

Tensions and unresolved issues

There are a range of challenges in designing, implementing, and researching practice-based PD. For example, determining which goals make sense within a particular professional learning context (van Es et al., 2019), identifying the most appropriate artifacts to use (Sherin et al., 2009), and designing effective PD around the artifacts (Beisiegel et al., 2018) are complex, interrelated decisions. These types of decisions typically have multiple options, with both affordances and constraints, that may influence teacher learning opportunities and well as research questions and analyses. Once a design is decided upon, facilitating the PD has its own set of challenges such as how to guide productive discussions that scaffold teacher noticing and support their reflections around the artifacts of practice (Jilk, 2016), and that foster both personal and social growth (Westbroek et al., 2019). More research is needed that examines and compares the affordances, challenges, efficacy and impact of different types of practice-based PD.

Trend: online professional development

Among the biggest concerns of teachers for improving their practice is the need for more and flexible time to access and process new information (Merritt, 2016). The COVID-19 pandemic accelerated the shift from face-to-face to online PD programs and increased and normalized the availability of video conferencing platforms (Ferdig et al., 2020; Lockee, 2020). Online PD has the potential to provide anytime, anywhere access that alleviates teachers' time constraints. As more professional development moves online to take advantage of its flexibility, increased access, and scalability, a tendency may be to view online and face-to-face PD as distinct from each other (Peltola et al., 2017). However, Fishman (2016) argued that they are not different and in fact "online teacher professional development is *professional development*" (p. 14). The quality or success of a PD program is not a function of whether it is online or in person or a combination of the two, but rather a function of its instructional design (Dede et al., 2016).

Forms of online professional development

Numerous online professional learning options are available for teachers including online courses, workshops, and professional communities; curated resources such as video libraries; and virtual instructional coaching (see [Schachter et al., 2019](#) for more specific examples). This plethora of options ensures there are multiple avenues for teachers to take part in self-guided, personalized learning or to participate in an online network or professional community ([Macià and García, 2016](#)). Fully online and hybrid PD courses have become increasingly prevalent over the past decade ([National Academies of Sciences, Engineering and Medicine, 2020](#)). Fully online PD experiences can be structured as synchronous, with all participants interacting in real time; or asynchronous, where participants work at their own pace; or some mix of synchronous and asynchronous. Hybrid or blended learning models offer a combination of face-to-face and online experiences.

In the last several years, a number of successful face-to-face PD models have been adapted or redesigned to become online learning experiences for teachers. Examples of materials adapted for synchronous courses include iRaise, a science literacy program ([Jaciw et al., 2016](#)), and GENA's lesson study, a mathematics lesson study program ([Schoenbach et al., 2016](#); [Francis and Jacobsen, 2013](#)). Adaptations for the development of asynchronous courses are beginning to take place as well, and corresponding research on their effectiveness and impact is underway ([Seago et al., 2020](#)).

The nature of synchronous PD, in which teachers come together in real time in a shared virtual space, often for an extended period of time, offers more opportunities for peer interactions than asynchronous PD. Thus, synchronous courses generally encourage discussion, collaboration and community building, as well as individual accountability for their participation in collective activities ([Schoenbach et al., 2016](#)). Technological tools such as audio and video conferencing, text chats, and collaborative document editing provide a variety of avenues for communication between participants as they teach and learn from each other synchronously ([Fishman, 2016](#)). In addition to increasing the demand and urgency for online professional learning opportunities, the COVID-19 pandemic spurred improvements to video conferencing platforms, enabling increased collaboration and flexibility through features such as screen sharing and breakout rooms, as well as the ability to link easily to tools like whiteboards, Padlets, and Google Jamboards.

Asynchronicity allows participants access to PD at any time, in any location with available internet, and can potentially eliminate the often-mentioned lack of scheduling flexibility and geographic distance ([Meritt, 2016](#); [Pletola et al., 2017](#)). Asynchronous forms of online learning have resulted in positive findings related to teachers attitude and self-efficacy ([An, 2018](#)) as well as high satisfaction and relatively high levels of information sharing ([Yoon et al., 2020](#)). Although asynchronous online PD is highly valued by teachers ([Parsons et al., 2019](#)), the focus on self-directed learning can prove challenging for collaboration and interactivity ([Altman and Harsh, 2017](#)). An emerging body of literature speaks to the potential of asynchronous PD, despite concerns regarding community development and feelings of isolation ([Yuan and Kim, 2014](#)).

Interest in providing scalable, accessible and cost-effective PD has resulted in the rapid evolution of massive open online courses (MOOCs) and MOOCs for Educators (MOOC-Ed) ([Kleiman and Wolf, 2016](#)). MOOCs - which may be synchronous, asynchronous, or some combination - have clear potential for engaging and educating large numbers of teachers around the world ([Misra, 2018](#)). Although there are important concerns such as low completion rates and uneven quality, researchers are beginning to outline design considerations to help ensure the courses follow best practices and offer meaningful experiences (e.g., [Hodges et al., 2016](#)).

Professional organizations such as the National Science Teachers Association (NSTA) imagine the future of teacher learning as a hybrid model that successfully integrates online learning with site-based efforts to provide convenient, immediate, and self-directed learning opportunities ([Byers and Menez, 2016](#)). NSTA has formally collaborated with school districts and universities that use its Learning Center in order to extend and enhance local face-to-face efforts in a hybrid form. For example, after taking part in in-person workshops and incorporating what they learned into their classroom practice, teachers can participate in moderated online discussions around shared student work ([Byers and Menez, 2016](#)). Blending face-to-face and online PD in this manner has led to beneficial learning outcomes documented in numerous studies ([Bowen et al., 2012](#); [Murphy et al., 2014](#); [Fishman, 2016](#)).

Effectiveness of online professional development

Although the research literature on online PD is limited, there is increasing evidence as to its positive effects for the participating teachers, even when compared to face-to-face options ([Fishman et al., 2013](#); [Ilaria, 2017](#); [O'Dwyer et al., 2010](#)). For example, Fisher and colleagues ([Fisher et al., 2010](#)) report that online courses designed based on high-quality learning materials can produce learning outcomes that are similar to or better than face-to-face options. Multiple large scale randomized control studies have demonstrated that cohort-based, facilitated online PD sessions can have significant positive impacts on teachers' knowledge and practice as well as their students' achievement ([Dash et al., 2012](#); [Masters et al., 2012](#); [O'Dwyer et al., 2010](#)). On the other hand, a meta-analysis of STEM teacher PD and curriculum improvement programs by [Lynch et al. \(2019\)](#) found that programs in which teachers completed a portion of the PD online led to poorer student outcomes compared to programs without an online component.

While more research is needed to ascertain the effectiveness and impact of various forms of online PD, it is clear they offer a valuable option for large numbers of teachers. Online PD supports equitable access to resources that may not be available to teachers locally, such as teachers residing in rural communities ([Erickson et al., 2012](#)). In addition, online learning can be a good fit for teachers who are reluctant to share ideas in face-to-face settings but may be more comfortable doing so in digitally mediated interaction ([Dede et al., 2009](#)). Moreover, online PD is considerably more scalable than comparable face-to-face PD, and in many cases is

subject to fewer monetary and logistical constraints for teachers (Killion, 2013). Finally, especially relevant for teachers around the world who recently shifted to virtual instruction due to COVID-19, online PD can serve as important preparation to effectively lead an online classroom environment (An, 2020; Philipsen et al., 2019) and provide a social community for teachers working in isolation (Charteris et al., 2021; Lieberman and Mace, 2010).

Tensions and unresolved issues

A challenge to online PD design, enactment, and research is ensuring that teachers have the knowledge and skills to capitalize on the dynamic nature of technological advancement (Schneider et al., 2016). It is still unclear whether online PD in general is as effective as face-to-face options. However, the nature and design of online PD programs are just as varied and complex as face-to-face programs, and the outcome variables of interest are as wide-ranging. Certainly not all distance learning is effective, just as not all in-person workshops are effective. There is not yet a large enough body of research on how to design and implement effective online PD, but the demands and challenges currently faced by educators necessitate increased availability of professional learning opportunities, including remote options. More research is needed to understand the affordances and limitations of different online and hybrid PD models and delivery platforms to meet a variety of learning goals, including the role they might play across the trajectory of teachers' careers.

Trend: facilitation of professional development

As the demand for PD has grown, efforts to bring PD to scale have increased in the US (Marrongelle et al., 2013) and around the world (Krainer, 2015). Related to these efforts is a recognition of the critical role played by the individuals who serve as PD facilitators and the need for well-trained and knowledgeable PD facilitators leaders, and coaches (Bates et al., 2011). Skillful PD facilitators are critical to ensuring that the PD is carried out in a meaningful, engaging, and productive manner that ensures all teachers have the opportunity to learn (Borko et al., 2011a). Although the research base on PD facilitation has grown in recent years, it is not nearly as robust as the research on practice-based or online professional learning. In this section we consider three themes related to the facilitation of PD that are beginning to be more widely addressed: the facilitator's role, the preparation of facilitators, and frameworks for effective facilitation.

The facilitator's role in supporting learning and community development

Facilitators of professional learning play a variety of roles depending on the educational context, the goals of the PD, and the particular needs and interests of the teachers with whom they are working (Jensen et al., 2016). Facilitation roles are multilayered and include "listener, expert, critical friend, coach and mentor as well as teacher and workshop leader" (Perry and Bolan, 2018, p. 256). Typically, PD leaders support communities of teachers to examine their instructional practice and student thinking, which requires positioning the participants as both experienced professionals as well as adult learners (Ince, 2017). Facilitators play a key role in organizing and managing the conditions within which reflective professional inquiry takes place. For example, facilitators help to establish norms for collaborative discourse and guiding productive communication during workshops (Lefstein et al., 2020). By building a community that fosters confidence and capacity among the participating teachers, facilitators can serve as a social agent to empower teachers to transform not only their practice but also problematic aspects of their work environment (Goncalves et al., 2020; Luguetti et al., 2020).

The preparation of PD facilitators

Although there is general agreement facilitators play an essential role in providing all teachers with the opportunity for ongoing professional learning (Hadar and Brody, 2017), research on how to educate facilitators is sparse (Even, 2014; Sztajn et al., 2017). Yet, training and support for novice facilitators is critical given how new the field is and the fact that it is increasingly common for teachers to lead PD for their peers, often as part of school-based professional learning communities. There is a growing recognition that these teacher leaders need considerable guidance as they shift from implementing lessons in classrooms with students to leading workshops with fellow teachers (Huggins et al., 2017). Allen (2016) argued that this shift not only involves new resources and skills, but also the formation of a new professional identity commensurate with their facilitation responsibilities. More generally, educators of practicing teachers require a specialized knowledge base that is beginning to be better understood and articulated by the research community (Selmer et al., 2016). Perry (2020) has recently classified the knowledge needed by PD facilitators as knowledge and skills of teaching, facilitation knowledge and skills, and knowledge of professional development.

Several research programs offer insights into effective strategies for facilitator preparation, such as modeling, rehearsals and critically analyzing video cases. Modeling of PD activities involves the novice facilitators participating as teachers while more experienced facilitation leaders model or showcase exemplary practices (Even et al., 2003; Jackson et al., 2015). In some cases, modeling is followed by the novice facilitators collectively planning for and rehearsing their facilitation strategies in preparation for leading PD sessions (Borko et al., 2014, 2017). Working with a more experienced facilitator, Jacobs et al. (2017) relied only on the rehearsal of PD activities. Several research teams have designed video-based learning opportunities for facilitators, in which they viewed videos

of themselves or others leading professional development workshops and critically analyzed the facilitation moves and practices (Lesseig et al., 2017; Perry and Boylan, 2018; Schueler and Roesken-Winter, 2018). Similar to many of the PD programs highlighted above, recently developed programs for facilitator preparation tend to be practice-based, bringing activities and resources from teacher PD into the facilitator PD experiences (Prediger et al., 2019).

Following from the literature on teacher “noticing” during professional development, teacher leader “noticing” has begun to emerge as an important construct related to the preparation of PD facilitators. Lesseig et al. (2017) argued that PD leaders can benefit from structured opportunities to notice or attend to effective facilitation skills and resources in order to become more knowledgeable, purposeful, and effective. They offered several design principles for workshops that support PD leaders, including the importance of establishing clear learning goals, targeting the development of specialized content knowledge, and using artifacts of practice. Other research highlights not only the importance of facilitators noticing teachers’ ideas and thinking, but also gaining knowledge about how to productively act on those ideas (Schueler and Roesken-Winter, 2018; Tekkumru-Kisa and Stein, 2017).

Frameworks for effective PD facilitation

Several recently developed frameworks for effective facilitation shed light on the specific practices that are likely to foster teacher participation in and learning from PD (e.g., Arya et al., 2014; Gonzales et al., 2016; Tekkumru-Kisa and Stein, 2017; Van Es et al., 2014; Zhang et al., 2011). Most of these frameworks have a particular focus on leading practice-based PD, especially prompting verbal interactions during video-based workshops. Van Es et al.’s (2014) framework includes four facilitation practices aimed at generating productive conversations around student thinking: (1) orienting the group, (2) sustaining an inquiry stance, (3) maintaining a focus on the video and the mathematics, and (4) supporting group collaboration. Gröschner et al. (2014) additionally emphasize the importance of facilitators’ “mindfulness” as they use specific moves to foster a trustful, community-building atmosphere within a collaborative learning community. Arya et al. (2014) found that modeling, scaffolding, and co-construction of ideas were facilitation practices that benefited teachers when engaging in video-based discussions.

Tensions and unresolved issues

Reflecting global efforts to scale teacher professional learning is the need for increased attention to, and additional research on, the facilitation of high-quality PD (Kennedy, 2016; National Academies of Science, Engineering and Medicine, 2015; Prediger et al., 2019). In particular, there is an urgent need for additional research building on what is currently known effective facilitation strategies and how to prepare facilitators to skillfully utilize those strategies in a variety of contexts with diverse teachers. As many PD efforts pivot to address challenges such as COVID-19 and the pursuit of racial equality within educational systems, facilitators are engaging with new formats (i.e., online learning) and expanding professional learning goals. Flexibly and appropriately responding to teachers’ complex and rapidly changing circumstances mandates new types of facilitation roles, knowledge, and frameworks. It is incumbent on researchers in the field to address these evolving needs to ensure that facilitators have the tools and skills to meaningfully carry out their work even in uncertain times.

Trend: professional development with a focus on equity

The field of education has an obligation to attend to issues of equity, access, and justice to reduce the racial disparities inherent throughout our societies and especially in our schools. Recent cultural shifts and grassroot movements, such as Black Lives Matter, have contributed to an increased demand for PD models that ensure teachers have the necessary knowledge, skills, and pedagogical resources to meet this critical need across the globe. There is a small but accumulating body of literature about PD efforts to support teachers in their efforts to work equitably with racially, culturally, and linguistically diverse groups of students (Parkhouse et al., 2019). We label this research as having a focus on equity, while recognizing that others have used a variety of labels. For example, teacher professional learning programs that highlight inclusion and equity have been labeled as multicultural education (Banks and Banks, 2019), intercultural education (Cloonan et al., 2017), and peace education (Verma, 2017), among others. These programs generally feature strategies teachers can use to bring students’ home cultures and languages into the classroom, countering implicit biases and oppressive ideologies concerning people of color, and frequently highlighting instructional practices labeled as culturally relevant pedagogy (Ladson-Billings, 1992, 1995, 2014), culturally responsive teaching (Gay, 2002), or culturally sustaining pedagogy (Ladson-Billings, 2014; Paris, 2017; Paris and Alim, 2017).

Research suggests that most teachers will require substantial professional learning supports to respond productively to rapidly changing student demographics as well as increased expectations that they effectively address the needs of all students (Battey and Franke, 2015; Cobb and Couch, 2018; Osborne et al., 2019). Considering the manner in which teachers learn to become more equitable in their classroom instruction, Carter Andrews et al. (2016) argued that “practicing teachers cannot develop and maintain a humanizing pedagogy through experiences in one ‘diversity’ or ‘multicultural’ professional development seminar” (p. 171). Correspondingly, there has been a slow but steady increase in both PD opportunities and the related literature on how best to guide teacher learning about social justice, inclusion and equity in a manner that leads to classroom change (e.g., Foote, 2010; Parkhouse et al., 2019; Strutchens et al., 2012; Wager and Foote, 2013).

PD programs that highlight the importance of moving toward greater educational equity can motivate teachers to become more attentive to the increasingly diverse student populations that are in their classrooms (National Academy of Sciences, 2020). Further, such PD may serve as inspiration for teachers to consider ways to actively disrupt the systemic inequality that currently exists in K-12 schooling (Ladson-Billings, 2014; Martin, 2012). Providing teachers with opportunities for professional collaboration, dialog, and reflection around issues of (in)equity both empowers and legitimizes their role as agents of change (Hawkins, 2011), and supports movement away from assimilationist teaching toward the “curricularization of equity” (Paris, 2017).

We consider the current literature on PD with an equity focus through two lenses: content-specific PD with an equity focus and content-agnostic PD with an equity focus. Within both categories, some PD efforts are primarily concerned with increasing teachers’ knowledge and attentiveness to equity-related issues, while others move beyond awareness and delve into strategies for planning, teaching and assessing in ways that actively promote equity.

Content-specific professional development through an equity lens

Although not yet commonplace, there are an increasing number of content-specific PD efforts that have an equity focus, with the goal of integrating subject matter content and attention to equity within a given professional learning endeavor. Here we discuss the research on some of these PD programs for mathematics, computer science and science teachers, as these areas have been the focus of most published research, although certainly there are important efforts in other content areas.

In a recent review of the mathematics education literature, Yolcu (2019) argues: “Improvement of teaching practices has become necessary in the context of social perspectives and reform-oriented curriculum not only to address but also to facilitate the creation of socially just and equitable opportunities to learn mathematics. For example, one of the trends in the professional development programs focuses on the improvement of cooperative learning opportunities and meaningful group work experiences for all students” (p. 708). Others in mathematics education have developed PD frameworks that incorporate key aspects of culturally relevant pedagogy and studied teachers’ uptake of these practices in their implementation of mathematics lessons (Rubel and Chu, 2012; Timmons-Brown and Warner, 2016). Battey and Franke (2015) describe another approach in which teachers constructed narratives around race that challenged their thinking about the abilities and participation of students of color in their mathematics classrooms.

The field of computer science is marked by a pronounced racial participation gap, prompting a variety of efforts to broaden participation, accessibility, and inclusion (K-12 Computer Science Framework, 2016). Similar to mathematics education, researchers in computer science have developed a number of PD programs that encourage computer science teachers to integrate culturally responsive pedagogical practices (Coddling et al., 2019; Goode2020; Scott et al., 2010). For example, Goode and colleagues (Goode et al., 2020; Goode et al., 2020) developed a PD program for computer science teachers that focuses on disrupting “colorblind discourse” and instead encourages critical conversations about race. As Goode et al. (2020a,b) explain: “In an educational discipline marked by power, privilege, and pervasive and systemic patterns of underrepresentation, this study demonstrates how long-term professional development can support teachers in developing an equity-based orientation toward computer science education” (p. 30). They report that this effort was successful in shifting teachers’ equity-based attitudes and beliefs, as well as moving teachers toward culturally responsive computer science pedagogy.

In science education, there have been a number of PD efforts drawing on a variety of design principles to encourage attention to equity (Bancroft and Nyirenda, 2020). For example, similar to mathematics and computer science, science educators have developed PD programs that support teachers to incorporate culturally responsive teaching practices (Brown and Crippen, 2016; Johnson, 2011). In a program entitled “Teaching for Equity in Mathematics and Science Education,” Bianchini et al. (2015) foregrounded issues of equity and diversity, using a variety of strategies that prompted teachers to engage in conversations about equity as well as having them conduct their own equity research projects. A different area of recent research in mathematics and science PD involves utilizing learning analytics technology to provide teachers with student data disaggregated in particular ways, such as by race or gender, and encouraging the noticing of patterns related to inequity or bias in their own classrooms (Raza et al., 2020; Reinholz et al., 2020). The variation across these programs suggests that there is an array of PD designs that hold promise in supporting teachers to become better equipped to intentionally disrupt inequality in their classrooms.

Content-agnostic professional development through an equity lens

A small number of scholars have focused on designing PD that centers equity, independent of a subject matter content focus. For example, transformative PD is a model that encourages teachers’ transformative beliefs and instructional practices, where “transformative” is defined as attending to equity and social justice in multicultural classrooms (Kose and Lim, 2010). “Teaching Respect for All” (UNESCO, 2014) is a transformative PD program that has been successfully used in several countries including South Africa to empower teachers as agents of social cohesion (Mogliacci et al., 2016). Peace education is another example of an educational and PD models that has gained considerable attention internationally (Bajaj and Hantzopoulos, 2016; Burns and Aspeslagh, 2014). Peace education emphasizes conflict resolution, particularly in response to violent conflicts or wars (Salomon and Cairns, 2011). PD that supports teachers to implement curriculum and practices aligned with peace education highlights the importance of becoming committed to and adept in classroom instruction that aligns with the goals of peacemaking, democratic dialog, and restorative justice (Parker and Bickmore, 2020; Verma, 2017).

Cochran-Smith (2015) describes teacher learning communities that formed with the explicit goal of promoting equity within their schools and classrooms, addressing concerns that emerged from the participating teachers' practice and considering how to best foster learning opportunities for all students, particularly those who have been historically marginalized by schools. Carter Andrews and Richmond (2019) add that it is not enough to focus on equity goals for students; to be effective, equity-focused PD must include equity goals for both student learners and teacher learners. They suggest that PD activities be designed to help teachers develop an asset-based pedagogical orientation and shared goals related to sustaining students' cultural assets and ensuring that all students have access to learning opportunities that will maximize their academic success and life opportunities. Larrivee (2000) further suggests the necessity for teachers to be willing to critically reflect on their own bias and ways in which their personal and professional identities inform their (in)ability to meet the needs of diverse student populations.

Zeichner (2011) makes a related point, arguing that teachers need to understand the communities and neighborhoods in which their children live. He proposes that teachers spend time interacting with community activists and people from neighborhoods who experience inequalities and injustices. This immersive approach allows teachers to see first-hand the conditions and environment in which their children live every day. A number of programs for both preservice and inservice teachers have provided immersive experiences in an effort to help educators humanize their students of color and cultivate praxis or critical reflection on the world in order to change it (Aujla-Bhullar, 2011; Stacy et al., 2020). In a similar vein, international field trips have been studied as a means to support teachers' intercultural awareness and competencies, particularly trips to developing countries (Alfaro and Quezada, 2010; Baecher and Chung, 2020).

Tensions and unresolved issues

PD focused on equity prompts teachers to articulate the underlying theories and reasoning behind their craft with respect to reaching all students, to confront the existing obstacles and tensions, and to deeply consider pedagogical improvements that promote social justice. Although this is a trending topic in the recent education literature, teacher participation in such PD is still relatively rare. Banilower et al. (2018) reported that only a quarter of science teachers and 20% of mathematics teachers indicated that they had participated in PD with a focus on incorporating students' cultural backgrounds into instruction. Clearly there is a need to scale up PD related to equity, along with clarity as to what such PD should look like. In particular, more research is needed to understand the design criteria for effective PD in this area, and helps teachers shift their beliefs and practices related to ensuring an equity focus in their classrooms and in their students' learning outcomes.

Discussion

The start of the new century has brought exciting new technological innovation, diffusely organized and disruptive social movements, and most recently, the greatest pandemic that modern society has faced - all of which have heavily impacted schools, teachers and students. Educators have begun generating wide-ranging strategies to address these novel challenges, including moving the field forward with expanded professional learning opportunities. In this article we have reviewed several of the salient and trending topics related to PD that have been taken up across the globe in the last decade. We anticipate that in the next decade the field will make considerable progress in each of these areas, leading to a better understanding of how to support teachers to learn and thrive in diverse contexts, even during a time of rapid globalization, change, and uncertainty.

This article spotlights four PD trends: practice-based professional development, online professional learning, facilitation of professional development, and PD focused on equity. We highlight current research in each of these areas, while also pointing out some of the existing tensions and unresolved issues that may be fodder for future lines of research. Practice-based learning by design requires thoughtful attention to the specific, local contexts in which teachers work, including using artifacts of practice to reflect on the needs of their students and collaboratively designing high quality instructional materials to meet those needs. The demand for online PD has greatly increased, prompting researchers to move quickly to delineate the affordances and limitations of this modality and speak to its potential in supporting a variety of learning outcomes of interest. Most PD programs, regardless of focus or modality, are led by facilitators who support teachers' community development and learning, thereby driving the need for research pertaining to the development of facilitation skills and expertise. Lastly, there is a heightened interest in PD that addresses issues of equity, inclusion and social justice. This type of PD helps teachers both to become better able to meet the needs of the increasingly diverse student populations in their classrooms and to play an advocacy role for underrepresented youth more generally. Although the article attends to each of these four trends separately, they are in many ways intertwined. Each trend has a unique scope of work and draws on a particular extant literature base, however future research may benefit from efforts to combine them in creative ways – such as preparing facilitators to lead online, practice-based professional development that focuses on equity.

Introduction

A central notion in theories of workplace learning is the intrinsic and mutual relationship between working and learning. In teacher learning as workplace learning three themes come together: (1) the content and organization of teachers' work, (2) the content and process of teachers' learning in the context of their classrooms and schools, and (3) teacher learning as continuous professional development during the teacher career.

During the last four decades, workplace learning has been an important item in discussions on vocational education and professional development in industrialized societies. These discussions cover the broad field of economic and cultural developments, technological and organizational innovations, knowledge economy and knowledge creation, and professional development and vocational learning in schools and work organizations. In the field of education, workplace learning has shown to be a promising approach for the development of productive learning contexts in teacher education and continuing professional development.

In this article, teachers' workplace learning is defined as changes in teaching practices in classrooms and schools that are mediated through individual and collective teacher learning and problem-solving processes in the school (Ellström, 2001). At the core of workplace learning are teaching practices in classrooms and schools, and insights in how these practices are related to student learning.

Teacher professional development is the generic term under which programs for teacher learning and formalized learning activities are organized and discussed. These programs and activities can be organized inside or outside the school. Teachers' professional development can be defined as those processes and activities designed to enhance the professional knowledge, skills, and attitudes of educators so that they might, in turn, improve the learning of students (Guskey, 2000). In a broader approach professional development is linked to the professional career of teachers, from initial teacher training to leaving the profession: a process filled with plateaus, discontinuities, regressions, spurts, and dead ends (Huberman, 1995). This process of lifelong learning also includes a variety of informal learning experiences in school as well as in private life outside the school. According to Kyndt et al. (2016) informal learning results from engagement in daily work-related activities in which learning is not the primary goal. Informal learning is undertaken autonomously, either individually or collectively, but without an instructor. It often happens spontaneously and unconsciously. From the learner's perspective, it is unintentional, and outcomes are unpredictable.

In this article we focus on teacher learning in the context of the school. We discuss teacher learning in the context of the school as a dimension ranging from formalized training and professional development to informal learning in classrooms and schools. This

[☆] *Change history:* December, 2020. Structure, focus and authors of the article are completely maintained, as compared to the 2010 version of the article in the third edition of the Elsevier Encyclopedia (volume 7, pp. 569–574). When we prepared the manuscript for the third edition in 2008 teachers' workplace learning was a relatively new topic of study. During the last decades a growing body of research results has been published. This is accompanied by the development of new theoretical perspectives on teacher learning and professional development, and on research approaches that differ from the traditional evaluation method for professional development research. These developments are given attention in the actualized article for the fourth edition. Nevertheless, the main conclusions of the third edition article have been maintained.

also includes off site programs in which implementation in classroom and school is part of the course. In many instances, teacher workplace learning is a mix of formal and informal learning activities.

Recently, professional development programs often build on workplace learning insights. The aim of this article is to explore the field of teachers' workplace learning in classrooms and schools, as it builds on, and adds new insights to teachers' professional development and teacher learning in schools. The question is how and in what directions teacher learning can be promoted in the context of work in classrooms and schools. First, the state of the art in teachers' professional development and learning will be shortly characterized. Next, recent insights and research results in teachers' workplace learning will be discussed.

Teachers' professional development and learning

Teachers' professional development and teacher learning literature shows a magnitude of insights regarding views of learning (acquisition vs. constructivism), designs (fragmented vs. ongoing and systematic), and opportunities (formal and informal, mandatory and voluntary, serendipitous and planned). Lifelong curriculum of teachers' professional development seems fragmented and incoherent, as [Borko \(2004\)](#) observed, which seems to be caused not so much by a lack of understanding, rather a lack of a collective sense of urgency of teacher professional development and learning.

This sense of urgency and the rationales for professional development diverge considerably among schools, districts and countries. In general, two main rationales can be distinguished, which can differ depending on the quality of schools and teachers. A first rationale, often used in contexts where the quality of schools and teachers strongly (are assumed to) differ, argues that educational reforms are needed and require a great deal of learning on the part of teachers. Teachers need support and advice to understand the reform and work according to the reform. A second rationale, often found in contexts where the quality of schools and teachers is (assumed to be) high in general, starts from the nature of teachers' work. Student learning itself and teaching as the organization of student learning processes are assumed to be complex processes, in which teachers can continuously learn, develop and improve themselves. The first rationale assumes that teachers show personal inadequacies in need of repair, while the second rationale assumes that teacher learning contributes to fulfilment as a practitioner in support of students' learning.

Attention is growing for teacher learning and teacher professional development programs situated in the workplace in contrast to off-site programs. The assumption is that on-site would be more effective than off-site. However, in general there is hardly any empirical evidence for this assumption, because effectiveness of both is determined by the learning goals and both are found to be relatively effective in this respect. Off-site activities entail workshops, conference sessions, seminars, lectures, and other short-term training events on subject matter issues and topics like cooperative learning and classroom management. Design elements and conditions that can enhance the effectiveness of these activities are longer duration, connection with teachers' work context, collective participation, focus on subject matter and especially how students learn specific content, and emphasis on analysis and reflection ([Desimone, 2009](#); [Van Driel et al., 2012](#)). By identifying these design elements and conditions for off-site learning, it is a small step toward recent on-site professional development methods that are embedded in daily work in classrooms and schools. These work-embedded methods include training within the school or local context, creation of ongoing professional communities, teacher design teams, lesson study, and inquiry groups. In addition to the previous remarks this shift toward workplace learning can be summarized as:

- from a focus on teacher knowledge, skills, and teaching competencies, including new instructional methods, to a focus on student learning and specific teacher problems,
- from single sessions or a short series to long-term and ongoing,
- from a focus on change as something that is done to teachers and programs that change teachers as passive participants to change as a complex process that involves learning and teachers as active learners,
- from a focus on individual teacher learning to collective teacher learning in terms of professional learning communities.

As far as research has been executed regarding the effectiveness of learning activities that are embedded in daily work, it shows that teacher learning is promoted by a focus on subject matter knowledge for teaching, understanding of students' thinking, and instructional practices. Further, the process of meaningful learning is slow and uncertain, and some elements of teacher knowledge are easier to change than others. It takes time to develop a community. Teachers have little experience engaging in a professional discourse that is public and critical of their work and the work of colleagues ([Desimone, 2009](#); [Wilson and Berne, 1999](#)). In general, several methods for workplace learning have been developed (*coaching, supervision, and collegial consultation; mentoring and master-mate learning; development tasks and action-research; instruction in the workplace and application in the workplace; inquiry groups as data teams, learning studios and lesson study*).

Despite an increasing body of knowledge on design elements and conditions, there is little consensus about how professional development works, how the different elements relate, what teachers learn, how they learn, and how the professional development and this knowledge improve their practice. As [Kennedy \(2016\)](#) argues, all those lists of design elements and conditions are not really helpful in understanding how and why professional development works. Rather, what is needed is an understanding of the underlying theories of action. Such theory of action includes the central problems of practice that it aims to inform and the pedagogy that will help teachers enact new ideas, while translating these ideas into the context of their own practice. In addition to this theory of action, it is also useful to understand the theories of instruction and theories of context. Theory of instruction focuses on student results and refers to the relationships between the features of the professional development intervention, the intended changes in

teacher knowledge and instruction, and the expected changes in student outcomes. Theory of context refers to the school's organizational conditions that are necessary for implementation and sustainability of high-quality professional development in the school or in the classrooms.

Regarding the theory of context, most professional development research hardly takes the conditions of the daily workplace into account, while these conditions strongly determine the opportunities and limitations of the specific interventions and teacher learning (Bryck, 2015; Van Driel et al., 2012). Often the focus is only on the characteristics of the professional development initiative as an explanation for its effectiveness. When the intervention does not produce positive results, either teachers are blamed or the initiative is quickly discarded for the next new promising initiative. By contrast, examining the role of the organizational context can provide a more comprehensive understanding of the practice of how professional development unfolds (Kennedy, 2016). A useful concept to think through the organizational context for teacher learning is organizational routines, derived from organizational literature (Spillane et al., 2011). Organizational routines are generally defined as "repetitive, recognizable patterns of interdependent actions, carried out by multiple actors" (Feldman and Pentland, 2003, p. 95). The concept allows to move beyond the general lists of organizational conditions and enables an investigation of how work in organizations gets done: how it is created and planned, implemented, maintained and developed. Effective organizational routines are perceived as useful and more or less self evident. For example, in cases where professional development is implemented in the school and the classroom without aligning existing organizational routines with the professional development content, the position of the professional development effort will be isolated, resulting in low effectiveness and finally extinction. Another example refers to the role of leadership: organizational routines can reveal not just *that* leadership matters but also *how*. The concept has been used to show how leaderships' management of a new professional development promoted or constrained its implementation and sustainability.

In summary, the literature on teacher professional development and learning in schools has shown a shift toward aspects of workplace learning. Aspects of workplace learning have been implemented in professional development practices. At the same time a lack of understanding of the organization of professional development and learning opportunities and conditions of the workplace itself are observed. In the next sections the analysis of teachers' professional development and learning will be broadened by taking the mutual relationship between teachers' working and learning as the starting point.

Workplace learning

The identification of professional development and teacher learning in workplace contexts depends on the perspective from which learning is analyzed. Perspectives on workplace learning differ with regard to goals, outcomes, rationales, and managerial views. *Firstly*, workplace learning varies from adaptive to developmental (Ellström, 2001). In adaptive learning tasks, methods, and results are given, for example a new teacher in a school who is acquiring skills in working with this school's curriculum and instruction method. In developmental learning some or all of these aspects are not given, for example teachers in a subject department developing and evaluating innovative higher order thinking assignments for students.

Secondly, a broad range of possible learning outcomes for teachers in the workplace can be found, ranging from habitual reaction in which conservation is central to innovative reflective practices and inquiry (Bredeson, 2003). *Thirdly*, these outcomes can be realized at different interrelated levels of the school:

- (1) Individual or personal learning by teachers or school leaders within the context of the school,
- (2) Social learning in small groups or teams of teachers,
- (3) Learning that occurs across the school organization as a whole.

Regarding the level of learning outcomes in the school as a whole, a recurring problem is the lack of so called "snowballing". This is the diffusion through the whole school of new successful practices that were developed by an individual teacher or a small team. Moreover, in the context of social learning in teams, it is not uncommon that teachers report their learning results individually as personal learning results (Imants et al., 2020). *Finally*, as was discussed in the introduction, workplace learning ranges between formal and informal learning.

Teachers' workplace learning occurs in diverging interrelated contexts. In teacher education settings, workplace learning primarily is regarded as preparation for working, and qualification is the goal. In ongoing work settings in schools, teachers' workplace learning is regarded as contributing to productivity of schools, often as informal learning. This learning is assumed to be an intrinsic quality of professional work. In school reform settings, teachers' workplace learning is closely linked to the vitality of the school and to school improvement. In the individual perspective, teachers' workplace learning is regarded as learning for life and individual professional development.

Teachers' workplace

Formally the school as a workplace consists of organizational structures, like separate units that are charged with diverging tasks and responsibilities. However, the workplace of teachers is not restricted to these formal structures. Informally the school contains several spheres of influence and interaction, for example groups of teachers across formal units, or personal links between teachers and school leaders. For teachers, the work with students, inside and outside the classroom, makes up the

core of their work. Opportunities to enhance students' learning are central drives for teachers to participate in professional development. The largest part of their working day, teachers work individually with (a) group(s) of students, rather isolated from their colleagues. The most meaningful work experiences that promote teachers' workplace learning will therefore be gained in three interrelated activities:

- in subject and task specific instruction of students and in the guidance of these students,
- in the student related work with colleagues,
- in the ongoing enactments of organizational routines that are closely linked to the work with students and colleagues.

Together, this is the community of practice in which individual teachers participate (Wenger, 1998), and in which teachers' workplace learning can be expected to be primarily located. These communities include the teachers' own spheres of influence and interaction, and the formal structures in which their work with students and colleagues is organized.

School conditions and processes that are located in the administrators' sphere can be assumed to affect teacher learning processes and results in an indirect way, more specifically, as mediated by processes of reinvention and reinterpretation by teachers in their own sphere (Weick, 1995). For example, an educational policy document of a school or district will not influence teachers' learning directly. However, depending on how teachers interpret the school's educational policy, this document will affect teacher learning indirectly in foreseen and unforeseen directions (Luttenberg et al., 2013).

Schools as workplaces for teachers afford opportunities for learning. From their part, individual teachers elect how to engage in work activities and how to deal with the guidance provided by the workplace. This dual base of affordance and engagement for participation at work in the school, including the interactions between affordance and engagement, is central to understanding the kinds of teacher learning that schools are able to provide (Billett, 2001). Teacher agency plays a central role in how teachers perceive and enact these affordances. At the same time availability of resources and opportunities to enact these resources function as constraining or stimulating factors in teachers' engagement for learning (Eteläpelto et al., 2013; Imants and Van der Wal, 2020).

Workplace conditions in schools

The educational systems in industrialized countries are characterized by a long period of restructuring and standardization of work in schools, aimed at improved student learning results and the promotion of a new professionalism in the teachers' profession. Restructuring and standardization did have a significant but contradictory impact on the content, processes, and effects of teachers' workplace learning in schools. An example is the result of short-term improvements in scores on standardized tests for students combined with long-term tendencies of bureaucratization in schools and intensification in teachers' work. As a result, the long-term actual impact can be opposed to the formal aims of reform. This complex relationship between working and learning will be elaborated in this section.

In his review of general workplace learning research, Ellström (2001) distinguishes five groups of factors that can be assumed to be critical for *facilitating* and *constraining* the integration of learning and work: (1) the learning potential of the task, (2) opportunities for feedback, evaluation, and reflection on the outcomes of work actions, (3) formalization of work processes, (4) employee participation in handling problems and developing work processes, and (5) learning resources. Besides, schooling is a strongly moral and normative enterprise. In overviews of workplace conditions for teacher learning shared norms are often mentioned as a critical factor. Shared norms are added as a group of school factors to Ellström's general overview.

These general factors reasonably summarize the results of overviews of workplace learning in schools from the last 20 years. More specifically, the results of two recent review studies on informal and semi-formal forms of workplace learning (Kyndt et al., 2016), and teacher collaboration (Vangrieken et al., 2015) are frequently used in the following sections. Besides, we refer several times to the OECD (2013) TALIS study (Teaching and Learning International Survey). This large scale study presents an overview of workplace learning activities and outcomes for lower secondary teachers in 17 OECD countries.

Learning potential of the task

Generally, task complexity, variety, autonomy, and being in control are regarded as important determinants of the learning potential of the workplace. Traditionally, teacher work is viewed as complex, varied, and autonomous. In that respect, the school seems to be a favorable context for workplace learning. A recent review shows that individual teachers' autonomy serves as a foundation for informal learning activities like observation of colleagues without direct interaction, and individually consulting sources and media. However, while individual autonomy can be a positive workplace context for learning activities, teacher isolation within the school often is regarded as a restrictive condition. TALIS data indicate that most teachers in lower secondary education are still teaching largely in isolation, as over half of the teachers report very rarely or never team-teaching with colleagues, and two-thirds report the same rates for observing their colleagues teach. In general, developments in organizational routines can serve as impediments and opportunities for workplace learning. For example, with regard to variety as a determinant for workplace learning, studies on teachers' work show loss of variety (a combination of narrowing and formalizing the traditional teaching tasks), and simultaneously unwanted variety (adding new non-teaching tasks to teachers' work).

Opportunities for cross-school and cross-department exploration of teaching tasks expand workplace learning. Limited access to task accomplishment in other contexts and a narrow focus on individual task performance restrict workplace learning. Positive recognition of high level skills for special task performance expands workplace learning. On the other hand, workplace learning

is restricted when special skills for task performance are taken for granted. In this respect the egalitarian culture in schools can serve as a hindrance for effective workplace learning. Redesign of work in schools can expand effective workplace learning when the focus is on crucial problems of curriculum and instruction, and when teacher agency and engagement are promoted.

Opportunities for feedback, evaluation, and reflection on the outcomes of work actions

Activities in which teachers reflect on students' performance, work and thinking can promote teacher learning. Reflection in action frequently is identified as an activity in which teachers engage during informal learning. Reflection in action is promoted by activities like observing colleagues, encountering difficulties and unplanned situations, and developing and applying new practices combined with testing by experiencing and experimenting.

Feedback plays a crucial role in these reflective activities. Feedback on the results of work activities is considered to be necessary for learning to occur. The effects of feedback can be cognitive as well as motivational. About half of the teachers in the TALIS study report never receiving feedback on their teaching from their school leader, or other members of the school management. When these teachers receive formal or informal feedback on their practice, it is in a variety of ways, from a variety of sources. Almost 80% report receiving feedback following classroom observation, and nearly two-thirds report receiving feedback following an analysis of student test scores. Nearly nine in ten of these teachers report that student performance, teachers' pedagogical competency in their subject, and classroom management are emphasized in the feedback they receive.

The function of feedback depends on the existence of clear goals. At the level of classrooms and schools educational goals often are vague or inconsistent, and they can change during teaching. The problem of absence of clear feedback because of unclear goals can be an obstacle for teacher learning. On the other hand, explicating specific goals and aligning instruction to these goals can be assumed to promote teacher learning.

In schools, much information is available that could serve as feedback and promote reflection on the quality of teaching and learning, for example school self-evaluation reports, reports by the inspectorate, files of student assessment outcomes, aggregated student test results, and teachers' accounts of classroom experience (Little, 2012). Systematic use of these data on student performance, work, and thinking as sources for teacher and team learning hardly occurs in schools. Work with "data teams" shows that data-based decision making in schools is a promising instrument for teacher and student learning (Schildkamp et al., 2013).

Formalization of work processes

The daily educational and pedagogical practices in the school are important opportunities and constraints for teacher learning. This learning is focused on subject content, pedagogic and instructional methods, and classroom management (Scribner, 1999). Traditional curricular forms of formalization (fixed content, regulations, and procedures) and new forms of standardization (testing and output control) can be distinguished. Both formalization and standardization of daily work processes and outcomes in schools tend to dominate instruction, classroom management, and organization in schools. For example, a persistent problem in education is the limited flexibility to deal with student diversity in schools and classrooms, notwithstanding inclusive aims. Moreover, dominant images of how schools and classrooms should be structured and function still build on traditional scientific management principles, combined with the new public management model (NPM). A gap exists between the innovative expectations on workplace learning in schools, and the highly formalized instructional practices and images of schools.

However, starting from the observations that (a) work in schools is strongly regulated by informal and recurring practices and by accompanying implicit expectations, and (b) that the daily knowledge base of teachers is strongly tacit, a collaborative process of aligning instruction and guidance practices can also contribute to teacher learning. This learning by joint formalization should not be confused with simply replacing an old instructional method by a new one (Smith and Gillespie, 2007). Interactions and discussions with colleagues and others are often mentioned activities for informal learning. Mutual adjustment of instruction and guidance to shared, explicit goals for student learning can serve as the starting point for a collegial dialogue on effective instruction. Fixed instructional practices are questioned and tacit beliefs are made explicit and open for discussion. Examples of contexts for such professional discussions are Lesson Study, teacher design team or data team, and PLC. In that case, the aim is for teachers to get a better understanding of (1) what and how their students' learn and think, and (2) how student learning is promoted by teachers' instruction and guidance.

Teacher participation in handling problems and developing work processes

Learning is facilitated if teachers have access to and are able to successfully participate in problem handling and activities aimed at the development of improvements in instruction and guidance, both formally and informally. Interactions, discussions, and sharing with colleagues are frequently observed informal learning activities. This also holds for collaboration in committees and networks. Teachers share positive perceptions of participation in decision making in schools with regards to instructional, pedagogical, and curricular topics, but they perceive participation in decision making on administrative topics less favorably.

Teacher participation in decision making can create frustration, anger, and distrust when the implementation of decisions that were made is blocked or not promoted by school management. Teachers should be able to participate in all the steps of cycles in which improvements are developed: planning, development, performance, and evaluation. When the majority of teachers is only

expected to perform instructional tasks that are planned, developed, and evaluated by teacher leaders and managers, learning will decrease.

Task interdependence in teachers' work

Three subject teachers are asked by their unit leader to grade tests of thirty students who made the test for a colleague, and who is absent due to illness. Because of the study progress of these students and the school regulations regarding grading there is time pressure on this task. In such situations teachers often collaborate in the form of division of tasks that are executed individually. In such case every teacher takes ten tests for grading. However, these three teachers recognize that the absent colleague prepared the test from a specific point of view that differs from their own viewpoints. So they decided that before grading, they should explore and discuss the specific approach of their colleague, to realize a fair and uniform grading of the students' work. As a result the grading transformed from a divided quick task for individuals with low interdependence into a joint problem solving task with high interdependence. A rich learning context was created based on their own enactment of the unit leader's request. Besides interdependence, this case illustrates the role of affordances and teachers' agency and engagement.

Teachers' collegial interactions vary in task interdependence and alignment (synergy in directions of aims and actions of different actors). High alignment and interdependence, for example in the context of joint problem solving, are associated with richer and more stimulating learning environments for teachers. This collaboration can produce shared understanding and investment, thoughtful development, and a fair, rigorous test of selected ideas. Lower levels of interdependence and alignment occur when teachers are exchanging stories, tips, or materials. This can result in reinforcement of and emotional support for maintaining low-quality practices (Rosenholtz, 1989). Moreover, contrived forms of collaboration and balkanization within the school of isolated groups with groupthink show the risk of counterproductive effects of collaboration.

Shared norms

Shared norms that affect teacher learning in the workplace can be distinguished in two types: norms regarding student learning and development, and norms regarding teachers' work and relationships with colleagues. Collective focus on, and shared responsibility for student learning are identified as important characteristic of teachers' professional communities in schools. However, according to Lortie (2002) the development of these shared norms is seriously hindered by the absence of a shared conceptual and technical language or a common technical culture in schools. Nevertheless, in-depth analysis of teachers' professional conversations shows that skepticism on the opportunities in schools for developing shared norms over-simplifies and underestimates the potential of teachers' collegial practices for teacher learning (Horn and Little, 2010).

Isolation from colleagues has a negative effect on teacher learning by creating "invisible walls" between teachers and diminishing the valuable role of collaborative activities (Scribner, 1999). This individualism, in which personal experience plays a central role, is regarded as a defining feature of the teaching profession, mainly because of the still dominant way of organizing teaching in regular classrooms and subjects with only one teacher responsible for student learning. In strong traditional cultures teachers collectively defend this individualism and existing conceptions of appropriate curriculum and instruction, even in the face of student failure. On the other hand, strong innovative and professional cultures can contribute to norms of collegiality and experimentation, and to teachers' expansive, informal learning. School leaders play a significant role in establishing an inhibiting or facilitating school culture. Besides they function as relevant sources of information, direction, and feedback.

Learning resources

Four resources for workplace learning are (1) teachers' prior knowledge, (2) curricular and instructional materials, (3) time, and (4) support and rewards. Teacher learning by experience presupposes "conceptual tools" (e.g., pedagogical content knowledge) and explicit knowledge about student learning and how student learning is promoted by instruction and pedagogic methods. These conceptual tools and knowledge are used to identify and interpret relevant experiences while teaching, and they play an essential role in workplace learning. Besides willingness to learn, proactivity, openness, extraversion, and outgoing disposition are relevant individual characteristics for teachers' informal learning.

Varied sources of instructional and curricular materials promote reinvention of instructional practices and lower barriers for experimentation. These practical materials provide opportunities for teachers to experience "what works" in daily classroom practice. However, when implemented superficially, the availability of the same sources bears the risk of counterproductive learning effects, because the anticipated student learning results are not realized in the case of superficial implementation.

Time to learn is an important resource for participation in formal and informal learning activities, as well as for reflection as part of the ongoing work process. The role of time often plays out in combination with related factors, for example school schedules, pressure from management regarding replacement of absent colleagues, etc. Professional development activities should be conducted often and long enough to ensure gains in knowledge, skills, and confidence. Formal availability of time for professional development is necessary but not sufficient as a resource for teachers to learn. Meaningful and time consuming collaboration is often squeezed to margins of teachers' work lives (at Sundays afternoons or weekly evenings in teachers' houses). The organization of time for work in schools is dominantly based on teaching schedules. Opportunities for teacher learning in schools will improve substantially, when time for teacher learning is the starting point of the scheduling processes instead of being the last thing to be added after all other activities have been organized. Without these organizational protections, time

for learning will disappear under the pressure of chains of incidents and daily routines. Therefore, a reassessment of the complex trade-off between time for production and time for learning in schools is needed for teacher learning to be well-organized within schools.

Scheduling is one of many factors influencing teacher learning. Others are full-time employment, which is identified as a facilitating condition for informal learning and continuity of staff, which is important for productive teacher collaboration. Moreover, teachers' informal learning can be restricted or supported by (lack of) freedom to experiment and to decide, (un)supportive relationships and (absence of) social support, quality of communication, and availability of common room for joint work. Identified rewards for informal learning are appreciation and recognition, and career opportunities. Lack of these rewards has counterproductive effects. Formal teacher induction programs are shown to be important for supporting beginning teachers. However, many teachers do not take advantage of this opportunity. Not even half of teachers in 17 OECD countries, on average, report that they participated in induction activities during their first regular teaching job. The school leader plays a decisive role in the availability of support and rewards. As such, the starting point for beginning teachers' use of induction activities is in the priority and facilities that school leaders give to these types of activities.

Conclusions

Before presenting conclusions, it should be noted that the insights presented in this article differ in the solidity of their base of research. In the past 10–15 years a growing body of professional development research has been reported on teacher workplace learning topics. An explicit shared conceptual language is developing. However, empirical research can lack the rigour that is needed for drawing general conclusions. Moreover, the national and regional educational contexts in which professional development and workplace learning are explored can differ considerably in terms of sense of urgency, rationale for professional development, and even in basic assumptions about teacher and school quality, making it sometimes complicated to compare.

The shift in professional development research toward workplace learning topics, insights and methods sheds light on restrictions in the traditional and dominant evaluation approach of professional development research. Firstly, in this evaluation approach the aspired for student learning results often are the only criterion for the measurement of effectiveness of teacher learning. In such evaluations often the focus is on the narrow defined *product* of professional development. The *process* of the learning of the teachers and the changes in their behaviors that lead to improved student learning remain largely unaddressed. Secondly, student learning results that fall outside the scope of originally aspired for results are not included in the evaluation. Thirdly, in the evaluation approach effects often are measured at an ideal-typical scale ranging from 0 (no effect) to +1 (optimal effect). Fourthly, the relationship between intervention and effect is often analyzed based on a one-way linear machine-like model. In such models separate conditions can only have one relationship with effects, either a positive or a negative relationship. In a more dynamic, interactive model that is based on workplace learning insights, effects in student and teacher learning range from -1 (negative or unwanted effects) to +1 (positive effects, including unforeseen effects). In addition, workplace conditions can be both expansive and restrictive. The direction depends on specific designs and inventions of these conditions in schools, and on interpretations and enactments of these conditions by agents in the school.

Summarizing the evidence, two basic perspectives on teachers' workplace learning and work-embedded professional development can be distinguished. Each perspective has particular assumptions on manageability and predictability of learning processes and outcomes in workplace contexts. In one view, teacher workplace learning is a specific activity that can be managed in the direction of formalized school outcomes and desired change. In the other view, teacher learning outcomes range from improvement in school performance to counterproductive effects on teaching and student learning. In this latter view, teacher learning is emergent, and steering opportunities for management to intervene effectively in this process are weak. An unanswered question is if these perspectives are complementary or contradictory toward each other.

Several potentially effective methods for workplace learning have been identified. The effectiveness of these methods should be regarded within the specific workplace contexts in which they are applied.

Six factors have been identified for the integration of teachers' working and learning in schools. Often, these factors are regarded as objective characteristics of the schools in which they emerge. However, it can be assumed that the impact of these factors is located in how they are interpreted and reinvented by teachers, and how teachers make sense of these factors in their daily work. Simply stated, one teacher will experience half a day in the week for professional development as a luxury, while another teacher will regard this time for professional development far too limited. One teacher will experience opportunities for collaboration as enriching, while for another teacher these opportunities will feel contrived. Teachers not only interpret the working conditions in the school differently at a specific moment, in terms of a continuing sense-making process they strongly differ in how they reinvent and reinterpret the content and strategy of workplace learning initiatives and professional development programs.

The relationships between these six factors and teacher learning are complex and paradoxical. These factors play a multidimensional role in teacher workplace learning: they potentially promote opposite directions of learning (reinforcing existing practices or promoting innovations) and they can have opposite side effects on teacher workplace learning (commitment or isolation, empowerment or alienation, etc.).

Traditionally, teachers have been regarded as passive participants in professional development and workplace learning programs, lacking knowledge and skills. Recently, teachers are regarded as active learners, and as agents in co-determining their working and learning goals, contents, processes and outcomes. In this respect, the six factors for the integration of working and

learning in schools also should be regarded as co-determined by the teachers themselves. Starting from insights in sense making in organizations and schools, all aspects of working and learning in schools can be regarded as part of an ongoing process of reinvention and reinterpretation by teachers and other agents in and around the school.

Generally, high-commitment, flexible, and learning-intensive work systems are assumed to promote the integration of learning and working, but scientific management principles still tend to dominate the design of many workplaces (Ellström, 2001). The same phenomenon seems to hold for schools. Rosenholtz (1989) distinguished learning enriched and learning impoverished schools. Rosenholtz and other researchers found far more learning impoverished schools than learning enriched schools (cf. Little, 2012). In reality many schools do not reflect ideal situations like learning organization, PLC, or partner in a learning network. Judging from the current organization of learning resources for teachers in schools, schools are still primarily organized to ensure student learning. Teacher learning remains an ad hoc and often individual affair.

Workplace learning in schools has potential advantages, like facilitated transfer of learning, accommodation of different needs and learning styles, ability to tap collective knowledge, and the natural promotion of collaboration and school renewal. But there are also potential problems in workplace learning. Not all learning “at work” is good, as is shown by negative lessons learned by (student) teachers, reinforcement of existing biases, and refinement of poor practices (Bredeson, 2003). Moving all learning to the workplace might create a too heavy burden on the workplace. Effective teacher learning in schools implies the search for a productive balance and creative swing between adaptive and innovative varieties of individual and collective learning, and on-site and off-site learning.

Introduction

This article, building on our research and practical experience, delves into lesson study (LS), a teachers' professional development practice originating in Japan. The different sections address: (a) the history and internationalization of LS; (b) its practice and benefits for the training and development of teachers at any educational level; (c) a novel theoretical approach to LS through the lens of complexity; and (d) a summary of our research and results on the practical use of LS in higher education (HE).

Background on the history and internationalization of lesson study

LS, the English translation of the Japanese concept “jugyou kenkyuu” (授業研究), is a practice whose roots stretch back to the Japanese Meiji era (1868–1912). This century of history has been addressed in different studies (i.e., [Ishii, 2016](#); [Makinae, 2019](#); [Shimizu and Chino, 2015](#)) and, less explicitly, Sato (1991) has linked it to the arrival in Japan of ideas based on the Herbartians' formal five steps. Nonetheless, differently to the previous studies, [Matoba \(2017\)](#) has briefly addressed the history of LS suggesting a more contemporary origin.

LS began to draw attention outside of Japan with Stigler and Hiebert's work (1999), which identified best practices from around the globe for improving education in the classroom. From the same year, the unpublished doctoral dissertation of [Yoshida \(1999\)](#) has also received credit as contributing to the internationalization of LS. Its popularization came after a period of growing interest in Japanese education during the 1980s and 1990s (i.e., [Beauchamp, 1991](#); [Cummings, 1980](#); [Horio, 1988](#); [Lewis, 1995](#); [Rohlen, 1983](#); [Rohlen and Björk, 1998](#); [Rohlen and LeTendre, 1996](#); [Shimahara and Sakai, 1995](#); [Stevenson, 1991](#); [Stigler et al., 1987](#)). Since that time, seeing a link between the good results of Japanese students in international tests and the training and teaching culture in the country ([Ingersoll, 2004](#)), teachers and researchers around the world have embraced and studied LS ([Lewis and Lee, 2017](#)), including in educational contexts as varied as Hong Kong ([Hargreaves and O'Connor, 2018](#)), Iran ([Moghaddam et al., 2015](#)), Uganda ([Fujii, 2014](#)), the UK ([Dudley, 2013](#)) and the US ([Akiba and Wilkinson, 2016](#)). These last two countries are where we find the most examples of LS being put into practice and of related studies.

Regarding the internationalization of LS, we wish to make a clarification for historical and scientific rigor. The well-deserved acknowledgment of [Stigler and Hiebert's \(1999\)](#) work and [Yoshida's \(1999\)](#) doctoral dissertation has sometimes come through statements that may have generated confusion. [Pang and Marton \(2003, p. 175\)](#) claimed that Stigler and Hiebert were responsible for the introduction “to the West of the Japanese approach of ‘lesson study’”, [Doig and Groves \(2011, p. 77\)](#) described Stigler and Hiebert's work as the means through which LS “was released outside Japan”, and [Crockett \(2002, p. 610\)](#) went even further and wrote that around 1997 “there were virtually no English language materials available on Japanese professional development”. These authors did not state that Stigler, Hiebert and Yoshida were the first to inform about LS outside of Japan, but their words—common in the literature about LS—could have easily produced that impression.

[☆] *Change History:* February 2021. This article includes an updated version of [Hervas and Medina \(2020a,b\)](#) in section 4 and the conclusions. The authors updated and restructured the original paper to meaningfully include it here.

We have already referred to an extensive selection of literature exploring the work and training of Japanese teachers during the 1980s and 1990s. In addition, our research (Hervas, 2022) has shown that also during the early 1990s we find studies clearly describing LS and other oblique or fragmentary references even earlier (e.g., Becker, 1989; Shimahara, 1979), many of them signed by Japanese originating authors; they all deserve credit in the history of LS overseas.

Lesson study: practice and benefits

LS is a central component of the professional development and in-service training (“kounai kenshū”) of Japanese teachers (Fernandez and Yoshida, 2004; Stigler and Hiebert, 1999), and it is used widely in Japan for teachers’ training and professional development at different institutional and administrative levels (Lewis, 2013).

LS consists of a cyclical, collaborative process of inquiry and reflection, carried out by a group of teachers who design a lesson plan named the “research lesson” (RL), teach it and observe it being taught, and analyze both the lesson itself and the process of teaching it, with the goal of improving lessons and teaching practices and, in this way, enriching students’ learning experiences (Lewis and Hurd, 2011; Fujii, 2016; Stepanek et al., 2007; Stigler and Hiebert, 1999; Takahashi et al., 2005; Takahashi and McDougal, 2016). In detail, LS involves the following phases or steps:

- Set goals for the RL according to the subject, topic and students’ knowledge gaps or “learning challenges” (Cajkler and Wood, 2016). The goals can differ depending on where LS is implemented (Lewis, 2015) and where the focus is placed (students’ learning, teachers’ training, curriculum development, etc.). In Japanese schools, for example, lesson goals often arise from transferring an institution-wide objective to the context of a particular subject.
- Design the RL (structure, methodology, activities, materials, etc.) and a proposal of inquiry (research topic, instruments to gather data, aspects to analyze, etc.) that teachers will conduct so that they can later analyze the RL. In the design of the RL, teachers also try to anticipate students’ possible approaches to the tasks in order to prepare a response.
- Implement the RL. In this phase, a teacher (usually one) teaches the lesson while the rest of the group observes and collects data according to the proposal of inquiry. On many occasions, each observer pays attention to a different aspect.
- Reflect collaboratively in a post-lesson discussion (Takahashi and McDougal, 2016) to analyze the RL based on what teachers have experienced and observed so that it can be improved and implemented in a different class—something that does not always happen and disseminated to the educational community through the public report of the lesson and what has been learned through the process.

This process brought Cheng (2019) to conceptualize LS as a knowledge management approach and is in line with other models for continuous improvement and reflective and inquiry-based educational practices such as “Plan-Do-Check-/Study-Act” (PDCA/PDSA; Langley et al., 2009), Analyze-Design-Develop-Implement-Evaluate (ADDIE; Branch, 2009) and action-research (McIntyre, 2008). Overall, LS has been considered useful for teachers’ induction and acculturation (Howe, 2006) and continues to show promising results for teaching enhancement (Hiebert and Stigler, 2017) and efficacy (Chong and Kong, 2012), for the development of teachers’ pedagogical content knowledge (PCK; Coenders and Verhoef, 2019), and for teachers’ active (Vrikki et al., 2017) and transformative learning (Wong, 2018). Also, it has been shown to offer possibilities for improvement science within education (Lewis, 2015) and potential for curriculum reform (Lewis and Takahashi, 2013). Several of these positive outcomes are related and similar to those reported in relation to the peer observation of teaching (Bell and Mladenovic, 2015; Steinert, 2010; Steinert et al., 2016).

These positive outcomes have contributed to the international growth of LS and to its transfer to different educational levels, including the training and professional development of university teachers through faculty or academic development programs. In this last scenario, we conducted a systematic review of the literature (Hervas, 2021) that evinced an increasing number of studies addressing LS as a faculty development practice, most of them from the US and concentrated in disciplines related to language and math. Although the number of studies is still limited and their results are mostly based on isolated experiences with few participants, they are also encouraging as they reveal beneficial outcomes of LS in the design of the lessons, the participants’ pedagogical knowledge, and the participants’ approach to teaching, such as those that we find among schoolteachers and preservice teachers. Nevertheless, our review also showed mixed results in relation to the participants’ reflection and collaboration, and less positive outcomes related to the organization of LS. Overall, our review made clear the need for further research to substantiate the practice of LS for faculty development in HE, a context in which the professional practice and idiosyncrasies differ from those of schools and schoolteachers.

Key features of LS from the epistemology of complexity

Despite its benefits, previous studies also reveal the need to improve our theoretical foundation to understand the purpose of LS, its features, and its use (Lewis et al., 2006; Murata, 2011; Rock and Wilson, 2005). This increasing theoretical foundation would help teachers who implement LS avoid the difficulties and misconceptions revealed by various authors (Chokshi and Fernandez, 2004; Diaz et al., 2005; Fujii, 2014; Postholm, 2019; Takahashi and McDougal, 2016; Yoshida, 2012). These situations often arise when

teachers uncritically adopt a process that, even in Japan, has not always led to reflective and collaborative teaching (Sarkar Arani et al., 2010).

In this section, we synthesize one of our articles (Hervas and Medina, 2020a), and we propose to expand the theoretical understanding of LS by observing it from the perspective of the epistemology of complexity (also known as “complex thinking” or “systemic thinking”). We adopt this viewpoint under the assumption that it is useful—though not necessarily required—for thinking about the cognitively complex teaching-learning processes (McAlpine et al., 2006) that, additionally, are executed in an educational reality that is itself unattainable and emerging.

From this unexplored angle, we make explicit tacit assumptions of LS that teachers may overlook when implementing it. When teachers do not keep in mind the underlying complexity involved in LS, they can become concerned or discouraged when their lesson plans do not develop as expected in the classroom, or when their peers' opinions sound unflattering. In contrast, recognizing the complex cognitive processes inherent to LS can help teachers carry out this process, which requires open-mindedness and the ability to tolerate unexpected outcomes. By applying the lens of complexity, teachers can capitalize on opportunities for reflection and avoid feeling overwhelmed.

Beyond its potential value to think and put into practice LS in any educational context, we propose that this perspective will be particularly useful in teaching contexts lacking any of the following habits, which are fundamental initial conditions for carrying out LS: (a) a culture of institutional support for teachers' inquiry practices (Takahashi and McDougal, 2016), (b) a routine of cooperation around creating lesson plans (Fujii, 2016), and (c) a systematic engagement in research-based professional learning (Akiba and Wilkinson, 2016).

We aim to explore LS using the framework of complexity, which would in turn allow teachers to implement it, while avoiding misunderstandings and maintaining their commitment to the process. Hence, in the following sub-sections, we interpret three key components and facets of LS from the perspective of the epistemology of complexity: its phases or steps, its product (the RL), and collaboration.

LS and its phases: emergence in LS

LS consists of a cyclical process that involves an ongoing feedback loop through which the output of the analysis of the RL is used as input for a new version of it. The phases of LS entail the creation of an original RL (and the forms of pedagogical and content-based knowledge connected to it), its deconstruction, and its reconstruction. We could imagine LS as a spiral path that, if resources permitted, would be infinite; teachers could always return to observe the RL, reflect on it, reformulate it and teach it again, cooperating with its contextualized evolution.

We argue that, to implement LS successfully, participants must tacitly acknowledge the unattainability of reality, recognizing the existence of weak emergence—phenomena and properties that, in organized systems, arise unexpectedly (Chalmers, 2006)—and of classroom dynamics beyond their control. These elements will affect their work and the design of the RL, especially because of two of the features of emergence described by Goldstein (2016): radical novelty and “ostensiveness”. Although Goldstein considers the notion of emergence inadequate and, under a different logic, talks about “self-transcending construction”, this author offers a clear definition for both features when referring to radical novelty as the unpredictability of phenomena from the initial conditions and perspective and to “ostensiveness” as the impossibility to foresee these phenomena until they happen.

Recognizing these features is key to implementing LS, because the continuity of its structural stability as a process is tied to the emergence of unpredictable events that take place and are observed in the classroom. Still, this recognition also runs the risk of making LS seem too challenging and thus diminishing teachers' commitment. We suggest that we can overcome the perception of difficulty by adopting other elements from the epistemology of complexity and situated cognition, a way of thinking in which knowledge arises as a means for coordinating an activity from within the activity itself, articulated with the social context in a specialized population niche and transformed through processes of assimilation and interpretation (Robbins and Aydede, 2009).

Classrooms are complex systems occupied by human beings that, as Morin (2007) suggests, could be understood as non-trivial machines, analytically unpredictable and indeterminable (von Foerster, 1984). These features though, do not mean that it is ineffective to try to anticipate behaviors in complex contexts; to the contrary, attuning oneself to a complex system can occur by accident, but, at a cognitive level, it can also occur through conscious reflection (Robbins and Aydede, 2009). LS practitioners should not confuse unexpectedness with nondeducibility, as phenomena can be both unexpected and, yet, deducible in principle (Chalmers, 2006). This idea reinforces the significance of two of LS's phases that involve aligning the RL with the behavior of the class as a system: (1) planning, as in Schön's (1987) “reflection for action” and van Manen's (1991) “anticipatory reflection”, and (2) revision, as in Schön's (1987) “reflection on action” and van Manen's (1991) “recollective reflection”.

However, if students are non-trivial machines, how can teachers who carry out LS “pre-decode” their actions and possible answers during the teaching of the lesson? Teaching actions can be understood as strategies (Morin, 1999/2010), adaptable rather than immutable decisions. Also, teachers—especially experienced ones—can make use of their PCK, which offers them ideas on common answers and difficulties that students face in relation to a particular content or activity. The anticipation of students' responses is considered a core practice for teaching (Grossman et al., 2009) and it is tightly connected to the practice of “press-onance”—a process that enables a contextualized anticipation of future states, based on the ability to experience situations vicariously (Robbins and Aydede, 2009)—and, in class, to “pedagogic resonance”—relational awareness of different elements that occur when interacting with students that resonates in the mind of the teachers, and which generates a pedagogic action (Trigwell and Shale, 2004). It is not that students' behaviors (individual or as a group) are entirely predictable and analytically determinable;

rather, teachers draw on professional knowledge that grants them a general idea of what to expect when presenting students with a given input (topic, activity, etc.). This awareness helps them to design the RL, foreseeing situations that might emerge, and increases their confidence in an RL that, in the end, is based on students' hypothetical performances.

During LS, teachers need not anticipate all possible outcomes that an RL could have, nor how every individual student could react to it. Despite an infinitude of situations that could arise, only some of them are highly probable and even fewer will become a reality. Even natural systems balance order and chaos (Crutchfield, 2012) and in them too we find patterns, self-organization, and specific points to which they seem to propel themselves (Boeing, 2016). Reflecting on the design of the RL helps teachers locate—at a cognitive level—critical “pressure points” from which small changes can generate a great impact in terms of students' learning. Pressure points related to content could be, for example, threshold concepts (Walker, 2013), concepts that, when understood, transform how students think about a topic.

Unpredictability and structured disorder, rather than being obstacles to LS, form the basic premise that allows LS to function. Teachers tacitly assume that in the dynamic of the class system, non-linear interactions will occur, in turn provoking unexpected behaviors that may be amplified by a self-reinforcing feedback loop. Without unpredictability and disorder—if everything in the classroom were foreseeable regularity—the processes of observation and reflection in LS would become unnecessary. Conversely, accepting that things will surely not play out exactly as we expected allows teachers to analyze what happens and re-design the RL accordingly. In short, we can only carry out LS successfully if we accept the emergent properties of classroom experience and understand that the RL is, at best, a method of experimentation.

The RL and the ecology of action

In LS, teachers witness and participate first-hand in the ecology of human actions; once these are set in motion, they are taken over by the environment, weakening our control over them and limiting our ability to understand them (Heath and Luff, 2013). From the moment the RL enters the classroom, we can imagine it as a raft floating downstream. The teacher takes actions to steer it and tries to navigate its way to port, making continuous adjustments as unforeseen currents alter the raft's path. After the RL has been taught and gets to port, the teachers reflect on and discuss the necessary modifications to make it more likely to successfully navigate the waters they have experienced. Thanks to this feedback, the RL regains a temporary state of equilibrium, ready to be launched again. Still, the waters it will navigate next time will be different and might offer new challenges. For this reason, even if the RL sometimes recovers stability, as long as it continues to be taught in new contexts with new students, it will continue being taken over by the environment, facing disequilibrium and needing to be adjusted.

As seen, the RL itself is a stable system, but it is mobile and subject to an irreversible flow, without which it cannot operate. We find in this process an example of “endo-exo-causality” (Morin, 2005a,b, p. 37), a feedback loop of causalities between the RL and the phenomena that influence it: the RL is designed for a specific context, but the RL itself brings about unexpected events, which in turn affect it and make it possible to continue the process of LS. Students, their relationship to what teachers prepare, and the circumstances all affect the RL, as teachers observe and analyze these elements in creating a modified version. This process is an example of how, through interaction with the environment, both a system overall and the product of the system experience self-organization.

When teachers remain open to unpredictability, they participate in uncertainty, incorporating it into the logic of the RL using rationality. We follow Morin (2005a,b) in understanding rationality as a quality that draws on dialog between our logical structures and reality, without pretending—unlike rationalization—that our logical structures encompass reality. In so doing, teachers consider not only the present choices, but also the decision tree they lead to, as Schön (1983) pointed out for reflection in action. Thus, in trying to anticipate contingencies that might appear when the RL is implemented, teachers construct design networks of great complexity, as if drawing what in physics (Nolte, 2010) would be a map of trajectories intersecting the phase space.

Acknowledging that not all paths and problematic situations can be identified a priori, LS participants do not envision the RL as determining a linear and immutable course of action. The RL is, on the contrary, a space of possibility; it is a product—“biodegradable” in the action and the surrounding context—in which LS practitioners are invited to embrace uncertainty as something productive (Mintz, 2016) and act as an attentive audience, ready to learn from any possible divergence from the expected.

Learning through cooperation and joint reciprocal reflection

LS is a collaborative process, but its collaborative practices and structures are sometimes left behind when LS is transferred to contexts outside Japan, revealing misconceptions in its practice and the need for adaptations (Takahashi and McDougal, 2016). When carried out in its full form, LS involves several teachers who are part of an epistemic community (sharing the same subject or a similar disciplinary field) and are subject both to a general normative framework (legal, institutional, curricular, etc.) and to their own system of (often implicit) rules, making of their collaborative process a complex system that evolves (Yuan et al., 2018).

Cooperation though, is highly shaped by context and culture. In Japan, professionals are often involved in “kaizen”—continuous improvement (Sarkar Arani et al., 2010)—a work philosophy that involves the willingness to unlearn thinking schemes and construct new ones with the help of colleagues. For this reason, we find in Japanese schools a culture of institutional support for teachers' inquiry practices (Takahashi and McDougal, 2016) and a tradition of engaging in research-based professional learning (Akiba and Wilkinson, 2016). In Japanese, we also find the concept of “hansei” to describe a practice of continual critique of our prior actions with the goal of learning from mistakes and improving our behavior in the future. In this sense, the LS group is shaped

as a setting that favors self-contemplation and openness to joint self-inspection as a path toward reconsidering what was previously known. Together, teachers co-construct knowledge through dialog and observation, under the assumption that there is no single correct way to create and conduct an RL; in this manner, LS can be described as an intimate practice (Lewis and Hurd, 2011) that requires teachers to reveal themselves professionally, contributing with their knowledge, practical experience, judgments and educational ethics and values. Overall, teachers collaboratively apply their reasoning, combining their different forms of knowledge to reach a consistent group vision of what to teach and to whom.

The RL is developed from this point of overall—though not necessarily complete—consensus; teachers must be willing to accept critique (of the work more than of the person who performs it) and to pursue self-evaluation. This process requires that participants develop a type of communication that allows them to place each other in the world cognitively, in order to coordinate their joint efforts (Robbins and Aydede, 2009). Through this joint reflection, interpersonal knowledge is engendered from the shared experience of a socially situated process (van Dijk, 2010), which has different representations in the mental models of the individual participants. This is yet another case in which the part (individual knowledge) and the whole (group knowledge) mutually influence each other, generating interactive learning paths for both the individual and the group.

It is useful to think of the group of teachers conducting LS as a system in the form of a learning community. This system is a perceived whole whose parts remain united, because, while continuously affecting each other, they operate for a common purpose. Despite resistance to change, by engaging in dialog and regulating the relations and interactions that happen in and arise from the system, the community evolves in codependence with the context. The group and its work are flexible and sensitive to the development of the RL. These traits make it possible for the group to face needs that emerge beyond what was planned and tolerate circumstances related to mistakes, “liminal spaces”—areas or states of transition and ambiguity where meanings and learners’ subjectivity are transformed (Land et al., 2014)—and “post-liminal variation”—variation in the point and state of exit out from the liminal space into a novel conceptual state (Calduch and Rattray, 2021). Despite the complexity of the definitions coming from the study of the threshold concepts, there are typical facets of any learning situation.

We should understand LS as a practice that, due to its origin, both requires and promotes a culture of cooperation among groups of teachers and at their institutions more broadly. In Japanese schools, for instance, LS groups specify broad institutional goals within their subjects through the RL; this specification involves connecting systems at different levels, contributing to develop a more organic perspective of the organization by recognizing teachers as driving forces for educational change and improvement. LS groups are then spaces guided by cooperation rather than competition, where the principles of solidarity and flexibility are applied. Practitioners strive to understand the inevitable diversity and contradictions that arise as signs of the group’s vitality. And this very diversity provides teachers with access to other viewpoints, allowing them to avoid self-deception and to use contrast to analyze their own standpoints, knowledge, and methods.

Some results regarding the practice of LS

To close this article, we present a summary of the most relevant results of our recent research on LS to complement, from an inquiry-based perspective, our readers’ understanding of LS. Recently, we analyzed the integration of an instrument called “Content Representations” (CoRes) within LS (Hervas and Medina, 2022). CoRes is a tool developed to uncover how teachers organize and conceptualize teaching and their PCK (Loughran et al., 2001, 2004). It takes the form of a table with different prompts related to the teaching of an idea and, for this reason, it is useful for lesson design (Loughran et al., 2008) and for teachers’ training, as it encourages teachers to reflect on their PCK and to reconceptualize their teaching practice (Bertram and Loughran, 2012).

Despite these positive outcomes, prior to our research, the integration of CoRes into LS had only been explored once (Juhler, 2016, 2017). Our research contributed to filling in the gap within the context of HE and revealed that the CoRes, even when approached superficially (in special, experienced teachers), enhanced the participants’ reflection and contributed to organizing ideas considering the design of the lessons in more detail and addressing newer aspects. However, our study also showed that the CoRes was perceived as time-consuming tool. For teachers’ training and professional development, we encourage the integration of CoRes into LS when we want to explore the teaching of a difficult lesson or of new contents introduced in the curriculum.

For these situations, Fig. 1 presents the instrument that we called “Content and learning outcomes representations for design and reflection” (CLOREDRE). CLOREDRE is a substantial evolution and update of the CoRes, created with the aim of facilitating deeper self-reflection and a more exhaustive process of lesson design. With that aim, CLOREDRE: (a) incorporates new prompts about teaching and learning formats, resources, learning environments, collaboration, inclusive teaching and learning, feedback, the integration of contents, and the inquiry about the lessons; (b) incorporates learning outcomes, with explicit demands for connecting them with contents and for connecting lesson and course learning outcomes; (c) departs from the use of concepts or ideas to address contents of different nature (knowledge, skills, attitudes, and values); (d) broadens the proposal of Nilsson and Loughran (2012) to include a section for self-reflection before and after the lesson; and (e) includes a new full section for making explicit the different ideas in the design of the structure of a lesson.

We have also analyzed the use of videos during LS and the potential and challenges that they pose (Hervas et al., 2020). We did this because LS might involve the recording of the teaching of the RL (to be used in the later discussion), but there is little research exploring the impact of the use of video (e.g., Lim et al., 2011). In this regard, some authors have urged caution when using videos in teachers’ training (Gaudin and Chaliès, 2015), as its effectiveness is often assumed rather than documented (Wang and Hartley, 2003).

Course title: ...	Goal(s) of the lesson (LG) State the main aim(s) of your lesson: LG1. ... LG2. ...			Connection with course goal(s) (CG) Make explicit the connection between the lesson goal(s) and the course goal(s): E.g.: LG1 relates to CG3 in ...

10. Are there any other people/agents that you can involve in teaching this content (hence, in designing the lesson)? <i>E.g.: peers, alumni, professionals, students, etc.</i>	...	...	...	...	...	...	...
						C	...
11. Are there any other factors that might influence T&L this content? <i>Refer any other factors</i>	...	...	...	...	...	...	...
						C	...
12. What elements will you incorporate to promote T&L this content with an inclusive perspective? <i>For each of the questions responded, if pertinent, describe any relevant element in this regard. E.g.: inclusive LLO/content, diversity of tasks, dual coding, activities that can be solved from multiple perspectives, inclusive references and examples, universal design of materials, granting accessibility to the learning environment, etc.).</i>	...	...	...	...	...	...	...
						C	...

Fig. 1 (continued).

Our study showed that the use of videos during LS has potential to improve the RL and stimulate reflection, as it: (a) grants perspective, (b) facilitates noticing, recalling, and analyzing pedagogical details, and (c) enhances communication by reducing the worries related to expressing opinions. However, we also revealed drawbacks, including the possible effect of cameras on behavior and difficulties in terms of logistics and the duration of the LS process that affected the chances of sustaining LS in the

13. When teaching these contents, how will you connect them? <i>Describe how these contents will be integrated so that the students achieve the LLO(s).</i>	...	...	...	...	...	...	...	
				C	...			
14. In case of need, what modifications would be required to adjust T&L these contents to a different format? <i>For each of the questions responded, if pertinent, describe any relevant adjustment that you would need to make. E.g.: you can refer the necessary changes to teach and learn these contents on-line, if the lesson is designed for an in-person format.</i>	...	...	...	...	...	...	...	
				C	...			
15. How are you planning to assess this lesson to improve it in the future? <i>Describe, if pertinent, how are you planning to enquire about your lesson (aims, how and what data you will collect, any dissemination plans, etc.).</i>	...	...	...	...	...	...	...	
				C	...			
Following this, make explicit the structure of the lesson fulfilling the following table <i>Add or eliminate rows as needed.</i> <i>Also, if a lesson involves more than a class, add rows as needed</i>								
When	T&L event <i>Describe, overall, what you designed to happen and how it would happen</i>	Duration <i>Minutes that the event would last from the student's perspective</i>	Teacher(s)'s actions <i>Describe what you will need to do before, during, and after the T&L event (e.g., prepare materials, organize groupwork, design assessment, etc.)</i>	Students' actions <i>Describe what your students will need to do during the T&L event</i>	Content <i>State the content addressed during the event (you can write the number used before and state previous and upcoming contents)</i>	Assessment & grading <i>State if/how the event will be assessed and graded and if/how it will incorporate feedback</i>	Resources <i>Name the resources & materials to use during the event</i>	Others
Before the class								
During the class								
After the class								

Fig. 1 (continued).

long term. For teachers' training and professional development, we encourage the use of short video segments to address specific aspects regarding the learning outcomes that we wish to promote.

Finally, we have also explored the topics that teachers discuss during LS, the learning opportunities that these conversations grant them (Hervas and Medina, 2021), and what these conversations reveal about how university teachers talk about their students

(Hervas and Medina, 2020b). Our results show that, more than any other topic, the participants discussed how to change the RL (its structure and the strategies used) in connection to promoting their students' engagement; concurrently, they also granted themselves opportunities to discuss the design process that they followed and how to improve it. In contrast, conversation about the teaching of the RL was less common and was of a descriptive nature, while conversation about their students showed room to become less teacher centered by focusing more on students' learning and thinking processes, and less on their (lack of) engagement and on general perceptions about HE students. For teachers' training and professional development, we encourage the use of conversation analysis to promote self- and peer-reflection and make explicit tacit ideas and beliefs.

Conclusion

In this article, we have attempted to offer an overall perspective of LS, building on our experience practicing it and our research on the topic. In the first section, we have described the history of LS and of its internationalization. We have recognized the research from the 1980s and the early 1990s that described the practice of LS and that, until present, has received little attention from researchers in our field.

In the second section, we have described LS, its different phases, and the benefits of it that the literature reveals. In addition, we have reported the outcomes and challenges of LS for faculty development in HE, an educational context in which LS is still making its first steps in terms of the body of evidence available.

In the third section, we have presented complex thinking as a cognitive attitude that can allow teachers to make sense of and carry out the process of LS. The goal of our theoretical analysis has been to make LS more understandable, therefore helping to confront the challenges that have arisen when teachers have tried to apply it outside of Japan.

Along the same lines, we have described how the LS cycle revolves around the RL, a product tailored to a specific context and to specific groups of students, assuming that their features are unique. This approach avoids oversimplification by paying attention to the local and particular, while simultaneously recognizing LS' embedding in a global context. LS' continuity depends on change, observation, and critical reflection and, through them, the original RL progresses. In LS, teachers forget about mechanical certainties and accept approximate knowledge and partial comprehension as starting points. From there, discoveries and learning happen, thanks to inaccurate predictions.

LS can contribute immensely to teachers' professional development, as it asks of them to be willing to shape their practices by taking advantage of emergence, boosting "pressonance" and operationalizing their own wisdom and knowledge. This process faces the complexity inherent in classroom systems by encouraging teachers to reflect on what they have experienced, embracing their own and others' reflective critique to devise strategies for improving the RL.

In this section, we have also suggested that LS is based on more an ecological than a mechanistic conception of reality. In this sense, LS is a process for constantly seeking an RL befitting a context, goal, and topic. The pursuit of an unreachable ideal—the perfect RL—is also the only way to bring teachers closer to achieving an envisioned archetypical lesson for a specific moment and situation. LS proceeds, and the RL evolves, as teachers engage in collaboration and tolerant dialog to problematize previous ways of doing (a process that benefits from the original Japanese cultural features), as they make use of strategy and situated thinking to attend to unforeseen situations and compare alternatives, and as they remain aware that they can only have ephemeral control over the actions that they carry out and the product that they create.

Deleuze said that "(...) there is no other method for finding other than a long preparation" (Deleuze and Parnet, 1977/2007, p. 7). We propose that—viewed from the perspective of the epistemology of complexity—LS is in fact a form of long preparation in which teachers move forward by developing tentative answers that lead to subtler questions.

Finally, in the last section of this article we have described the results of our previous research regarding the practice of LS, hoping to help teachers make informed decisions when practicing LS. First, we have shown the potential of integrating the CoRes within LS and the concerns that their combined use raises. Second, in a similar vein, we have described the implications and challenges of using videos during the practice of LS. Lastly, we have described what LS participants talk about and how they do so.

We hope that this review of LS, with theoretical and practical suggestions for teachers' training, will help teachers, future teachers, teacher educators and faculty developers when thinking about and implementing LS.

Acknowledgments

This chapter is derived in part (mainly section four and conclusions) from an article published in *Teachers and Teaching: Theory and Practice*, 26(1), 118–128 on March 26th, 2020, available online at <https://doi.org/10.1080/13540602.2020.1745174> and <https://www.tandfonline.com/eprint/WEFXNJ6W9BB7YUJB4MDI/full?target=10.1080/13540602.2020.1745174>. Susan Frekko provided English-language support for this chapter.

This article and our other studies here described were partly supported by the Spanish Ministry of Economy and Competitiveness under Grant [EDU2015-63712-P-BES-2016-076824].

In addition, we would like to express our utmost gratitude to our families and colleagues (friends) who, with their support and insights, contributed to enhancing our work and, more importantly, to making our journey this far a happy one. Particularly, we wish to share our gratitude with the members of the "FODIP" research and innovation lab at the University of Barcelona—very specially, with professors Francesc Imbernón

(Paco), Beatriz Jarauta, and Isaac Calduch—with Professor Mari Paz Sandín, also from the University of Barcelona, and with the members and staff of the Center for Research and Development of Higher Education at The University of Tokyo. Thank you!

Glossary

Construct Map Construct maps, like learning progressions, represent variations in observed skills, practices, and behaviors that help us to infer who possesses more or less of a construct (Wilson, 2005). Bounded by upper and lower anchors, these maps articulate in advance what structures (levels, facets, dimensions) of teacher FA practice look like and subject our construct theories to empirical investigation, and hence grounds for falsification. Construct maps are not rubrics or coding sheets; they are hypotheses about the structure of a dimension that requires quantitative study (Duckor et al., 2009)

FA moves Duckor and Holmberg (2017) identified 7 high-leverage FA moves that make a difference in student learning when used during lessons, minute by minute. The moves are:

- Priming – Preparing the groundwork
- Posing – Using an effective range of questions
- Pausing – Giving students adequate time to think and respond
- Probing – Asking follow-up questions that elicit student thinking and deepen student understanding
- Bouncing – Sampling on a variety of responses
- Tagging – Publicly representing the variation in student thinking
- Binning – Seeing patterns and using patterns to inform “Next Steps”

While these moves are interconnected, they don’t occur in rigid sequences. Rather, they are used flexibly and creatively. They can be mobilized “on the fly” in clusters—such as posing-pausing-probing—at key hinge points in a lesson. Moves can be planned and/or improvised during a lesson

Teacher learning trajectories Applying the logic of learning progressions to the study of teacher development, teacher learning trajectories are hypothesized levels of a construct along a dimension (Duckor and Holmberg, 2019). In the domain of formative assessment, these trajectories can be specified, examined, and interpreted with qualitative and quantitative methods in terms of content and structure

Progress guides A progress guide is a formative evaluation tool. Scoring guides are less cognitively and linguistically complex than an analytic rubric; therefore, they may be employed as a more student-friendly binning strategy. Progress guides tend to contain less verbiage and dysfunctional detail that might overwhelm students, including students learning English and students with special needs

Learning progressions Learning progressions describe a trajectory of learning within a content domain that spans a much longer period of time than a lesson or single unit of instruction. The trajectory may provide a multi-year image of students’ successively more sophisticated performance levels, for example, in addressing the big idea of “Why things sink and float?” in physics. Learning progressions are mediated by targeted instruction and curriculum. Heritage (2008) notes that a progression of learning in a domain can provide the big picture of what is to be learned, support instructional planning, and act as a touchstone for formative assessment

Any review of the myriad discourses on assessment literacy must confront two problems. First, one must review the multitude of theories of assessment proficiency; second, one must ground those theories in actual trajectories of assessment practice. Our focus in this article offers a third conceptual challenge, one that is aimed at unpacking the place of teacher understanding and use of formative assessment along trajectories of practice in a dynamic, evolving learning environments.

Rather than exhaustively survey all the literature related to what has been dubbed “assessment literacy” or take up debates on what teachers need to know and be able to do with “assessment data” for example, for State or national licensure exams, or produce a definitive review of the road to “formative assessment” that grew out of the evaluation literatures of the 1960s, our goal is more circumspect, and we hope, productive. The theses we explore in this article are intended to: (a) recall the need for

assessment reform in the US prior to the naming of formative assessment as a discourse field: (b) contextualize the development of formative assessment scholarship from its roots in evaluation theory; and (c) explore the conceptual frameworks offered by scholars for unpacking teachers' growth and development in the movement toward assessment for learning orientated practice.

When examining the literature on teachers' work—whether in the contexts of pre-service, induction, and in-service settings, projects, and programs—there is a paucity of educational research aimed at unpacking teachers' learning in the domain of formative assessment, not to mention the area of classroom assessment more broadly. There are expert-novice studies on teachers and teaching that focus on lesson planning, or enactments of lessons, and processes for productive reflection (See, e.g., Borko and Livingston, 1989; Putnam and Borko, 2000; Feiman-Nemser, 2001a,b).

But a clear, unswerving look at the individual development and comparative differences between teachers' knowledge and use of assessment practices has been undertheorized. The idea of developmental trajectories of formative assessment practice lurks beneath many discussions of effective classroom strategies and high-leverage teaching practices (TeachingWorks, 2018) but too frequently the development of these strategies and practices is left unpacked by scholars. The notion that teachers have mental models p-prims, even misconceptions that they replace with other schema through experience is absent from the literature. Rather than examining teachers' developmental trajectories and learning progressions in the field of formative assessment, notions of assessment literacy have been advanced to explain differences in teachers' practices (Stiggins, 2002). This approach has further led to the assembly of "measures" of self-reported beliefs, attitudes and dispositions toward classroom assessment (Gotch and French, 2014) rather than exploration of teacher learning trajectories and investigations of teachers-as-learners who develop over time (Duckor and Holmberg, 2017).

Whatever the role of these definitions or surveys of assessment literacy (and, by presumption, assessment illiteracy) may be for experts and educational researchers' knowledge base, there remains a lack of understanding of teacher development, growth, and change as formative assessors. Observed variations in naturalistic settings taken from samples of teachers moving from novice to more expert states of formative assessment practice have been scarce. There are likely many explanations for scholarly inattention and disinterest in teachers' development as a subject of rigorous study in the formative assessment literature. Part of the scholarly inattention is rooted in the historical struggle to define the field itself—against the backdrop to testing and evaluation theory. Experts were learning to define what makes formative assessment formative.

In this article, we ask the reader to move with us beyond static pictures of characteristics, definitions and predicates of "formative assessment" (FA) practice. The aim here is to move the field toward dynamic models of "assessing formatively" that reveal unfolding levels of mastery along trajectories that respect teachers' individual zones of proximal development. To do this, we ask:

- What can educational researchers and experts tell us about expected outcomes i.e., levels of progress, for teachers who are developing their expertise with questioning techniques and strategies, making sense of data from an exit ticket, putting concept maps on the dry erase board to document variation in student thinking, using a gallery walk for a peer-based feedback protocol, or differentiating feedback through self-assessment comments added to a shared document, and so forth?
- What do we know about how, and in what ways, teachers learn and enact discreet FA practices, strategies, and tactics along various proposed dimensions? Are there facets of FA practice that resist the notion of qualitative differences and progressions? If so, which ones? Why?
- What are teachers' zones of proximal development with respect to the planning for enactment of and reflection on FA practices individually and taken as a whole? To use a mountaineering metaphor, are there "fixed lines" and "bottlenecks" and "slippage" that "naturally" accompany the individual's movement toward FA expertise?
- What can educational researchers and experts tell us about types of consistent, timely and useful feedback at a given level of FA practice for those making the journey toward learning goals in this domain that are generalizable and reproducible?

Each of these kinds of research questions, while beyond the scope of inquiry for this article, is nonetheless necessary for new, dynamic conceptualizations of teacher learning and growth in the discourse field of formative assessment.

Teachers, like students, are learners when it comes to formative assessment and each deserves to be seen through the research lens of growth as they learn to master new practices. Each and every teacher who is learning to formatively assess, for example, is developing those skills, practices, and dispositions across the arc of a career. There are pivot points and roadblocks along the path. There are breakthroughs and cul-de-sacs along the way.

We argue that teachers-as-learners are at the present moment the necessary subjects of education reform, which include but are not limited to reforms aimed at what experts have called "formative assessment" (Black and Wiliam, 1998a,b), "assessment for learning" (Stiggins, 2002), and "visible learning" (Hattie, 2009). Prior to *No Child Left Behind* (2001), it is clear that local assessment reform led by teachers was well underway. In fact, while not always visible to many outside observers, schools in the US were engaged in assessment reforms decades well before the rise of these particular FA discourse fields. Classroom teachers and school leaders were experimenting with "formative" assessment practices for children in multiple settings that delivered results without referring to the term formative assessment. Educational researchers and experts and teachers were more focused on authentic assessment and portfolio-based assessment in the US context (Darling-Hammond, 1997; Duckor and Perlstein, 2014; Meier, 1995).

Assessment reform and school reform in the US context

Teachers and teacher learning are and have been at the center of school reform efforts in the US for over a half century. Progressive educators from Dewey to Delpit have emphasized how teachers can make a positive, sustained impact on the lives of their students in the educational system—from early childhood to adulthood. The pursuit of educational excellence and equity in public education demands careful attention to the daily work of teachers in classrooms.

Reformers have focused on powerful examples of teachers whose work unites pedagogical, instructional and assessment practices, weaving them into rich learning experiences for all students. Some of these same reformers have noted that high-leverage, promising, culturally responsive practices not only elevate all students' levels of authentic engagement and achievement, but that these practices are essential to better serving historically disadvantaged minorities and minoritized students (Ladson-Billings, 1995; Hollins et al., 1994).

In the US context, the work of Darling-Hammond (1997) epitomizes the promise of teachers' work and practice for aiming at better outcomes that serve historically underserved students. In the *Right to Learn*, Darling-Hammond reminds policymakers that schools that see teachers as levers of instructional and assessment reform do produce results on multiple measures of success. In documenting examples of schools where classroom and school level assessment practices work for children of color, Darling-Hammond (1997) wrote:

The innovative curriculum and assessment efforts of several of the original Center for Collaborative Education schools served as exemplars for [New York] state's initial rethinking of its curriculum and assessment practices [citing a New York State Council report, 1994]. Portfolio and performance assessments models from CPESS, International High School and Urban Academy ... provide examples of authentic assessments to school districts across the state (p. 156).

Portfolios are rigorously evaluated and often sent back for more work; students learn what it takes to develop a piece of work that meets the standards of inquiry in a field and the standards of written and oral discourse demanded by committee members. They get feedback and revise and revise and revise; they internalize standards; they develop the capacity for sustained effort and ambitious work (p. 157).

An alternative approach to reform uses standards and assessments as means of giving feedback to educators and tools for organizing student and teacher learning, rather than as a sledgehammer to beat schools into change ... (p. 241).

It is clear that effective and equitable schools are places where teachers integrate rich learning, teaching, and assessment practices. Assessment and instruction—in any subject or discipline—are woven together in a coherent, consistent whole by these teachers. The craft of good teaching is seamlessly integrated with good assessment practices in all of these case studies.

The argument for authentic assessment in action centers education reform on teachers and students' work in classrooms that blend assessment and instruction predates much of the literature on formative assessment. Yet echos of the formative assessment ethos and references to discrete FA practices and purposes such as feedback and evaluation resound in these writings prior to landmark studies of studies.

Darling-Hammond et al. (1995) noted that:

Increasingly, local schools, schools districts, and states are experimenting with these methods and with other alternatives to standardized testing for assessing student learning and performance. Persuaded that traditional standardized tests fail to measure many of the important aspects of learning, and that they do not support many of the useful strategies for teaching, practitioners are introducing alternative approaches to assessment in classrooms—approaches that help teachers look more carefully and closely at students, their learning, and their work (p. 4).

... [M]embers of school communities must be engaged in the development and use of these assessments. This is because teacher learning about the deep structures of curriculum, the nature and nuances of student thinking, and the connections between teaching efforts and student performances derive substantially from firsthand, constructivist encounters with assessment development, and from the subsequent evaluation of student work (p. 253).

No longer left to the outside evaluation expert or standardized testing authorities, teachers' daily assessment practices came to the forefront of the struggle for excellence and equity in K-12 education. Schools like Central Park East Secondary School (CPESS) in New York City epitomize what teachers engaged in the struggle for educational equity and specifically what deep equity looked like from an assessment lens. Learning by doing became synonymous with assessment by doing in the Coalition of Essential Schools movements across the US (Duckor and Perlstein, 2014;Sizer, 1996; Wiggins, 1993).

In "Assessing Habits of Mind: Teaching to the Test" Duckor and Perlstein (2014, pp. 16–17) document that teachers' expertise in assessment for learning was indispensable to minoritized students' success and was being implemented in the late 1980s and early

1990s in the US Interviewing a pool of teachers who were deeply involved at these reform-oriented K-12 schools, Duckor and Perlstein found:

CPESS educators developed their approach to assessment to better articulate their approach to teaching and learning. They thus had a strong sense not only of what they were assessing but also of how and why they were assessing it. "CPESS," recalls English teacher Lori C., "was based on formative assessment. ... What we were doing was figuring out where the kids were at, what did they need to know, how were you going to get them and bridge the gap between where you wanted to get them with the project and where they were in their learning and understanding."

Numerous studies, books, video artifacts, and testimonies attest to deeper learning through teachers' work with students, and students' assessment of their own and others' work. Teachers exposed students to embedded authentic assessment across 6 years of schooling—from 7th to 12th grades. It was the deep immersion in formative assessment practices—supported by staff, administrators, and parents—in a community of learners committed to those assessment practices that led to achievement gains and myriad opportunities to advance individual outcomes (Bensman, 2000).

The shift from formative evaluation to formative assessment discourse

Paralleling the lived experiences and emerging literatures on authentic assessment, portfolio assessment, and feedback-driven classroom-based assessment practices from urban American primary and secondary schools in the late 1980s and early 1990s, a group of assessment experts weighed in on "what works" to advance student assessment for learning. Documenting studies from reformed classrooms and reforming school settings across the globe, these scholars began to use the term formative assessment to articulate a complimentary stance on systemic, school-based reform in the US.

Moving away from the classical era of formative evaluation (Scriven, 1966, 1973), this cadre of US, Australian, and UK experts re-centered the classical evaluation field on formative assessment; that is, they looked toward a set of teacher-driven practices that showed promise for improving student learning outcomes. A pioneer in the evaluation field, Scriven (1966) argued that "... formative evaluators should be very sharply distinguished from the summative evaluators." He further noted that "[evaluators] may certainly work in developing an acceptable summative evaluation schema, but they should of course exclude themselves from any judgmental role" (pp. 8–9).

Sending a clear warning to evaluators who fail to distinguish between assessment purposes, Scriven presciently wrote:

... testing for learning of certain rather delicate and pervasive concepts may be itself destructive, in that it makes the student too self-conscious about the role of a concept at too early a stage, thereby preventing its natural and proper development ... It would not show up on tests, indeed it might be stultified by the intrusion of tests, in any given year, but it has to be in the curriculum in order to produce the finished products that we desire. In this case, evaluation seems to be both incompetent and possibly destructive (p. 9).

Traditionally, the evaluation field had focused on the needs and designs of test makers and curriculum developers' agendas to improve the quality of results from evaluation studies. The uses of assessment data—for teachers and students—was secondary and not the subject or focus of Scriven and others' concerns in the evaluation theory field in the 1960s.

Stake (1967) is an outlier in the evaluation field. He identified the limits of classical approaches to evaluation to inform teaching and learning. Imbued with methodological formalism and the pretense of scientific method, too many evaluations emphasized the problems of stakeholders outside the messy classroom, the imperfect curriculum, and the dynamic ever-changing relationship between learners and their teachers. Stake noted: "Today, educators fail to perceive what formal evaluation could do for them. They should be imploring measurement specialists to develop a methodology that reflects the fullness, the complexity, and the importance of their programs. They are not" (p. 523).

Noting the skepticism toward evaluation by teachers who assess daily and need assessment data for learning, Stake (1967) wrote:

Formal evaluation of education is recognized by its dependence on checklists, structured visitation by peers, controlled comparisons, and standardized testing of students. Some of these techniques have long histories of successful use. Unfortunately, *when planning an evaluation, few educators consider even these four*. The more common notion is to evaluate informally: to ask the opinion of the instructor, to ponder the logic of the program, or to consider the reputation of the advocates. Seldom do we find a search for relevant research reports or for behavioral data pertinent to the ultimate curricular decisions.[Emphasis added] (p. 523).

Dissatisfaction with the formal approach is not without cause. Few highly relevant, readable, research studies can be found. The professional journals are not disposed to publish evaluation studies. Behavioral data are costly, and often do not provide the answers. Too many accreditation -type visitation teams lack special training or even experience in evaluation. Many checklists are ambiguous; some focus too much attention on the physical attributes of a school. Psychometric tests have been developed primarily to differentiate among students at the same point in training rather than to assess the effect of instruction on acquisition of skill and understanding. *Today's educator may rely little on formal evaluation because its answers have seldom been answers to questions he is asking* [Emphasis added] (p. 523).

Evaluation theory dealt with schools, classrooms, and outcomes but it was incapable of seeing evolving relationships between teachers and students engaged in classroom-based assessment. In a groundbreaking work on evaluation, Bloom et al. (1971) ventured that assessment data from evaluation projects and programs could be useful for others, including teachers and students.

In the *Handbook of formative and summative evaluation of student learning*, Bloom and his colleagues claimed a new evaluation stance that was “intended primarily for present and future classroom teachers,” and represented the “state of the art” of evaluating student learning. In this period of transition, from formal “scientific” evaluation methods to the new, classroom-level assessment theory, the challenge was: How to make ostensibly summative tests, formative? Using examples of “formative tests” from STEM subjects such as Chemistry (Fig. 1), these authors saw a unique role for teachers-as-evaluators and students-as-evaluators.

The teacher-evaluator was now expected to conduct “error analysis,” provide “corrective” feedback, and support interim unit-level interventions before the final results of learning in a given subject area. Compared to Scriven’s narrower conception of evaluation’s role in understanding schools and classrooms, Bloom and colleagues signaled a transition to classroom assessment practice as a crucial site of intervention in educational outcomes: “We regard formative evaluation as useful not only for curriculum construction but also for instruction and student learning” (p. 117).

For Bloom and colleagues, the teacher—not the expert outsider or policy maker or curriculum developer—shifted more clearly into focus. The teacher was seen as the one who monitors student progress and who supports students’ efforts at self-assessment. All of a teacher’s complex work, practice, and efforts in the classroom would soon become the rightful subject of study for formative evaluation. But was that enough for those interested in the role of assessment to shape outcomes—between teachers and students—at the classroom level?

Signaling a break with the field of the classical evaluation tradition, a new cadre of formative-oriented assessment scholars and learning theorists sought to place more effort and attention on teachers’ and students’ work in the classroom. In the 1980s and 1990s, classroom assessment and evaluation began to focus on discrete lessons and units of instruction, which were suffused with exchanges of assessment information and “turns of talk” analyses. Formative processes and cycles, as they were called, were expected to advance learning outcomes inside a learning community—not only visible with outside indicators. By advancing teaching and learning goals, the problems of testing and evaluation reporting advocates were far less important for this generation of assessment scholars. They were firmly committed to the promise of assessment for learning during instructional cycles.

Sadler’s work (1989) marks an important transition from formal evaluation study of schools to classroom-level assessment theory’s role inside them. Sadler saw teachers having an essential role to play in facilitating students’ transition from passively receiving feedback to active, self-monitoring activities during the learning segment. Teachers nor their students were merely objects for formal evaluation procedures conducted by experts. Rather, both teachers and students became the subject of situated assessment practices that influence learning outcomes in real-time. Sadler wrote:

The transition from teacher-supplied feedback to learner self-monitoring is not something that comes about automatically. For an important class of learning outcomes, the instructional system must make explicit provision for students themselves to acquire evaluative expertise. It is argued that providing direct and authentic evaluative experience is a necessary (instrumental) condition for the development of evaluative expertise and therefore for intelligent self-monitoring. It is insufficient for students to rely upon evaluative judgments made by the teacher (p. 143).

Sadler noted that the assessment practices recommended “are not radically new, and are already employed in some instructional systems.” The emerging lexicon of formatively-oriented, classroom level assessment practices were known to teachers and teacher educators and could be traced by the qualitative study of classroom artifacts, discourses, and relationships. By the 1980s and early 1990s, Sadler described these “formative assessment” practices as including: the use of descriptive statements and exemplars and “criterion sheets” to help students understand and “specify” standards; the inclusion of self-assessment routines to monitor progress; and the facilitation of peer assessment protocols to invite more feedback into the learning environment prior to any final, summative, and/or end of year evaluation.

Building on the work of Sadler and others, with the publication of “Assessment and Classroom Learning” in *Assessment in Education* in 1998a and “Inside the Black Box: Raising Standards Through Classroom Assessment” (1998b) in *Phi Delta Kappan*, the shift away from the aims and purpose of formal evaluation theory to the new assessment theory was complete. Black and Wiliam (1998a) called forth a new era:

This article is a review of the literature on *classroom formative assessment*. Several studies show firm evidence that innovations designed to strengthen the frequent *feedback* that students receive about their learning yield substantial learning gains. The perceptions of students and their role in *self-assessment* are considered alongside analysis of the strategies used by teachers and the *formative strategies* incorporated in such systemic approaches as mastery learning. There follows a more detailed and theoretical analysis of the nature of feedback, which provides a *basis for a discussion of the development of theoretical models for formative assessment* and of the prospects for the improvement of practice (p. 7) [Emphasis added].

As if to further underscore the break with the problem of making summatively designed tests “formative,” a problem which clearly occupied Bloom and colleagues in the 1970s, the cadre of newly emerging assessment experts highlighted the relationship between assessment and learning inside classrooms. In a vein similar to advocates for authentic classroom-based assessment in the US, Black and Wiliam (1998a) wrote when surveying the international scene:

Fig. 1 Errors made by two students on the formative test in the chemistry unit.

One of the outstanding features of studies of assessment in recent years has been the shift in the focus of attention, towards greater *interest in the interactions between assessment and classroom learning and away from concentration on the properties of restricted forms of test* which are only weakly linked to the learning experiences of students. This shift has been coupled with *many expressions of hope that improvement in classroom assessment will make a strong contribution to the improvement of learning*. So one main purpose of this review is to survey the evidence which might show whether or not such hope is justified. A second purpose is to see whether *the theoretical and practical issues associated with assessment for learning* can be illuminated by a synthesis of the insights arising amongst the diverse studies that have been reported (p. 7) [Emphasis added].

By the late 1990s and early 2000s, Australian, US and UK scholars converged on the essential question: What makes formative assessment formative? Many had dropped the concern for making summative assessments formative (an agenda that continues today) and devoted themselves to the emergent field of formative assessment. Marked by a deep skepticism about the goals of evaluators and test-makers, these authors placed teachers' and students' work in assessment for learning on the same footing as the evaluation expert and curriculum designer.

Echoing school reformers in the authentic and portfolio assessment traditions of the Coalition of Essential Schools, the Career Academies, and New Tech schools in the US, these global advocates for formative assessment (FA) and assessment for learning (AFL) signaled a similar commitment to student-centered learning reform and equity-focused classroom assessment practices from the UK, Australia and Canada. Teachers, like their students, were now expected: (a) to actively participate in assessment, (b) to co-construct new identities as self-, peer-, and classroom assessors, and (c) to live and learn in the traditions of progressive education broadly defined. While it is clear that dynamic assessment (DA) provided the most explicit conceptual links to Dewey and Vygotsky, FA and AFL advocates embraced a similar if implicit commitment to constructivist teaching and teachers who were constructivists (Black and Wiliam, 2009; Leung, 2007; Perrenoud, 1998; Poehner and Lantof, 2005).

Characteristics, processes and facet-based perspectives on formative assessment

The rise of the formative assessment literature, despite its pivot away from the early classical evaluation theorists and firm rejection of standard psychometric solutions for testing, has nonetheless struggled to make its mark. Formative assessment theory and theorists have struggled—for meaning, for subjects, and for objects of study—as they built a body of professional knowledge. While tending to deemphasize the complexity of teachers' subjectivity and various trajectories of practice in complex classroom settings, scholarship in formative assessment tended toward describing sets of aspirations for best practices, on a case by case or project by project basis. The objects of study were sometimes actual groups of teachers and students, other times these studies documented sets of disembodied practices, strategies, characteristics and definitions.

Consistent with the need to define formative assessment practice as a distinct body of knowledge, and locate it within a perspective that differed from testing and evaluation theory, research has tended to focus on setting boundaries for, seeking better definitions of, and building consensus on the characteristics, processes and facets of formative assessment (Black and Wiliam, 2009; McMilian, 2010; Moss and Brookhart, 2019; Stiggins, 2002; Wiliam, 2011; Wiliam and Thompson, 2008). It has become common to catalog myriad practices, strategies and tactics that teachers and students should "know and be able to do" in the formative assessment literature.

These normative and aspirational forms of discourse are visible and traceable in discussions of key features of formative assessment today. The *characteristics-processes-facets perspective* animates much of the pioneering work in the formative assessment literary corpus. At a time when evaluation theory offered no solutions or clear directions for studying teachers' and students' work on assessment for learning, early authors worked vigorously to differentiate by careful definition and thick description what formative assessment was and was not, and how FA broadly defined looked in exemplary classrooms.

The early formative assessment researchers had to sketch outlines of what "formative" interactions might look like from general observation as they developed new theory and began documenting practice. In a 2 year investigation of secondary science teachers, Bell and Cowie (2002, pp. 61–79) identified ten characteristics that helped launch the search for authentic formative assessment. They determined that formative assessment:

- Is seen as being responsive;
- Is often a tacit process;
- Involves multiple sources of evidence related to the purposes for which the formative assessment is done;
- Relies on student disclosure;
- Uses professional knowledge and experiences;
- Is an integral part of teaching and learning;
- Is done by teachers and students;
- With attention to the purposes for engaging in formative assessment;
- Is a highly contextualized process; and
- Involves the management of dilemmas.

Hinting at the issue of teacher growth and development, the authors write "formative assessment is a highly complex and skilled activity for both the teacher and the student. Formative assessment is not something teachers are likely to learn to do in a short session in an inservice course. It is a professional skill that develops with increasing professional experience, awareness and reflection" (Bell and Cowie, 2002, p. 79).

Taking a similar approach to the *characteristics perspective*, Stiggins (2002, p. 5) lists behaviors and actions and beliefs that describe instances of authentic assessment for learning. He writes that when teachers "assess for learning, they use the classroom assessment process and the continuous flow of information about student achievement that it provides in order to advance, not merely check on, student learning." Maintaining a focus on characterizations of teachers' work, without necessarily addressing teacher's development or growth in practice, Stiggins determined that teachers "do" assessment for learning by:

- Understanding and articulating in advance of teaching the achievement targets that their students are to hit;
- Informing their students about those learning goals, in terms that students understand, from the very beginning of the teaching and learning process;
- Becoming assessment literate and thus able to transform their expectations into assessment exercises and scoring procedures that accurately reflect student achievement;
- Using classroom assessments to build students' confidence in themselves as learners and help them take responsibility for their own learning, so as to lay a foundation for lifelong learning;
- Translating classroom assessment results into frequent descriptive feedback (versus judgmental feedback) for students, providing them with specific insights as to how to improve;
- Continuously adjusting instruction based on the results of classroom assessments;
- Engaging students in regular self-assessment, with standards held constant so that students can watch themselves grow over time and thus feel in charge of their own success; and
- Actively involving students in communicating with their teacher and their families about their achievement status and improvement.

Shepard (2000, 2005, 2008), like others working to define the literature and field in the early 2000s, also sought to determine the main characteristics of formative assessment. In an effort to ensure careful delineation between assessment purposes and uses, Shepard addressed the concern with misconceptions and confusion about what formative assessment is, and what it is not.

Partly driven by a concern for teachers and students in the US who were being influenced by hyper-accountability regimes in the wake of NCLB, Shepard's scholarship established firm boundaries to preserve the gains of formative assessment advocates. Working against the marketing efforts of curriculum and testing companies that soon promised pre-packaged "formative assessments" to clients across states, Shepard (2008, p. 293) held the line for the formative assessment reform movement. Shepard argued that "effective" formative assessment is:

- More than simplistic alignment, tasks must "embody" learning goals;
- It should be curriculum-embedded (both in timing and substance). Tasks should be instructional tasks to provide insights about learning as it is occurring;
- By definition, it must enable the supportive learning processes invoked in the formative assessment literature; and
- Instructional insights should lead to coherent, theoretically sound improvements in teaching.

Heritage and associates have also held the line on the need for clear, precise and common definition of the field of formative assessment against evaluation and testing agendas (Heritage, 2008, 2010; CCSSO 2008/2018; AERA et al., 2014). The development of standard definitions of formative assessment for professional bodies and associations that emphasize the central role of the teacher and learner in assessment discourse ensured boundaries while evoking the complete transition from any dependency on evaluation or test theory.

In addition to these developments, a focus on *processes and cycles* has also accompanied the formative assessment literature (Cowie and Bell, 1999; Hattie and Timperley, 2007; Moss and Brookhart, 2019; Ruiz-Primo and Furtak, 2006, 2007; William, 2010; William and Thompson, 2008). Moving from producing control over definitions and declarative norms, researchers have also offered pictorial representations of instructional and assessment processes. These processes represent elements and facets of practice that students and teachers are expected to engage in when assessing formatively. Some processes are rooted in empirical observations of actual teachers and students' work while others are products of expected and aspirational interactions.

Cowie and Bell (1999) offered a *process* "model of formative assessment" that aimed to describe and explain the formative assessment processes as carried out by teachers (and implicitly by their students). Cowie and Bell distinguished between two kinds of FA processes that teachers and students engage in: "planned" and "interactive." The process of planned formative assessment is characterized by the teachers eliciting, interpreting and acting on assessment information. The purpose of the planned formative assessment, they maintained, is to determine how the classroom level information is collected, interpreted and acted. The four aspects of planned formative assessment, according to Cowie and Bell, are interrelated and mutually determining (Fig. 2).

Interactive FA differs from planned FA in that a specific assessment activity is not planned; rather, it arises out of a learning activity. The teachers and students within the project interacted in whole-class, small-group and one-to-one situations. The process of interactive formative assessment involved the teachers noticing, recognizing and responding to student thinking during these classroom-based interactions:

The teachers discussed how they might not notice and recognise the significance of students' comments and actions because they lacked the experience and knowledge. They mentioned that *interactive formative assessment was difficult for beginning teachers and for experienced teachers with a new class*, say at the beginning of the year (Bell and Cowie, 1997). The teachers said their awareness of student thinking (what they noticed and recognised) was often triggered if a student response was unexpected or incorrect, or if a number of students indicated that they held a similar view (Cowie and Bell, 1999, p. 109) [Emphasis added].

While these characterizations of teachers' work in the domain of formative assessment from the *process perspective* show the dynamic, contextual demands upon teachers' (and students') development, as they each practice eliciting, interpreting and acting

Fig. 2 A model of formative assessment.

on assessment information, it remains unclear whether change and growth are possible, not to mention probable. Too often the study of formative assessment processes and cycles have not included robust schematic diagrams of those processes from any clear, well-defined developmental perspective.

Rather than confront the difficult and challenging trajectories of “beginning,” “experienced” “novice” “expert” or any ways of describing teachers transitioning in between these liminal states, research on characteristics and processes of formative assessment offers static pictures with many predicates and pictures. The research has also tended to treat the subjects of formative assessment as “knowers and doers,” rather than as learners and emerging thinkers working to develop expertise in practice.

Absent a developmentally sensitive perspective on teachers’ growth that acknowledges transitions and bottlenecks and pitstops, too many researchers have plainly ignored the problems of practice for teachers. The fact is teachers across many settings do not always know which FA practices, cycles, and processes are most effective, when to deploy them, or why a particular combination of FA strategies actually worked for a particular student in a particular classroom (Duckor, 2014).

Professional growth over time and developmental trajectories perspectives on formative assessment

While the majority of formative assessment advocates and researchers have rarely documented teachers’ learning in the FA domain from a developmental perspective, there are exceptions (Jacobs et al., 2010; Furtak et al., 2016; Wylie et al., 2018). Shepard (2000, 2005) has described how theories of learning informed various stakeholders’ perspectives on the purposes for evaluating students. While not addressing how these learning theories may influence teachers’ work and learning in classroom assessment explicitly, the crux of the argument brings attention to the link between learning theory and assessment practice for students and presumably for their teachers.

Implicit in this schematic representation (Fig. 3) is the notion that social constructivist perspectives on children’s learning (and by association, teachers’ learning) tend to emphasize formative orientations toward classroom assessment, whereas behaviorist perspectives on learning do not. Though a full articulation of teachers’ learning trajectories in assessment for learning practices is absent, Shepard’s argument implies that classroom assessment’s alignment with learning theory is useful, if not necessary, to achieve coherence and stability within school accountability frameworks and local classroom settings (Penuel and Shepard, 2016).

The logic of Shepard’s argument—that socio-cultural approaches to growth and development matter for authentic learning—as it extends to the study of teacher learning has been largely absent from the discourses of advocates for formative assessment. Educational researchers and experts who work in the domain of formative assessment have too often flirted with behaviorist approaches to teachers’ learning by ignoring the relevance of socio-cultural accounts of teachers’ learning in the FA domain itself. Rather than offer any coherent or systematic theory as to how, why, and what teachers learn while they are becoming formative assessors, the field has been silent about trajectories of FA practice. Strikingly, while students’ ZPD is acknowledged as part of the formative assessment conceptual apparatus, teachers’ ZPD with FA practice itself is not.

We note that Wilson and Sloane (2000), similar to Shepard’s (2000) account, put teachers’ work in classroom assessment forward as key to conceptualizing educational assessment reform and deeper learning outcomes. Wilson and Sloane argue, along with other authentic assessment movements during the 1990s, that “embedded assessment” systems that connect teachers’ and students’ use of information during instruction can also improve outcomes. Wilson and Sloane (2000) wrote:

Fig. 3 Interlocking tenets of curriculum theory, psychological theories, and measurement theory characterizing the dominant 20th-century paradigm.

Explanations of the distinctions between alternative assessment procedures and more traditional forms of testing frequently emphasize the importance of teachers' roles in mediating and interpreting the alternative assessment results within the classroom context (e.g., Chittenden, 1991; Wolf et al., 1991) as well as the more immediate and meaningful uses of the alternative assessment procedures in the ongoing instructional process (Cole, 1991; Darling-Hammond and Ancess, 1996). However, it is also recognized that such integration will require new views of the teaching and learning process, new roles for (and demands on) teachers, or even a new "assessment culture" in the classroom (Brown et al., 1992; Cole, 1991; Resnick and Resnick, 1992; Torrance, 1995a,b; Zessoules and Gardner, 1991). Preparing teachers to use these types of assessments in their classroom teaching may be a difficult challenge. Teachers' understanding and acceptance of innovations are crucial to the ultimate success of change (Airasian, 1988; Stake, 1991a,b) (pp. 190–191) [Emphasis added].

While Wilson and Sloane do not propose explicit theories of teacher learning, the argument for formative uses of assessment data and protocols requires a developmental perspective on students (and teachers!) who are learning how to assist one another in such exchanges. Implicitly, these embedded assessment systems are expected to influence and shape teacher practice and therefore teacher learning and preparation. Nonetheless, while emphasizing students' growth and progress, teachers' trajectories as embedded assessors, as we might call them, remains in the background.

Recent scholarship from the *professional growth perspective* has leaned into the role of teacher development to better articulate the gaps between experts and novices in research on formative assessment practice at the classroom level. Wylie et al. (2016) use the language of "dimensions" that build upon continua of formative assessment practice.

- Learning goals
- Criteria for success
- Tasks and activities that elicit evidence of student learning
- Questioning strategies that elicit evidence of student learning
- Extending thinking during discourse
- Descriptive feedback
- Peer feedback
- Self-assessment
- Collaborative culture of learning
- Use of evidence to inform instruction

Utilizing principles of validation and consensus building across various stakeholders over pre-service, induction, and in-service years, these authors posited “ten dimensions” of FA practices and articulated four levels of accomplishment for each proposed continua.

To represent variation, that is, qualitative differences in teachers’ practice along the proposed Using the Formative Assessment Rubrics, Reflection and Observation Tools to Support Professional Reflection on Practice (Revised FARROP) model, rubrics have been developed to describe both the teacher role and the student role in a particular formative assessment “dimension.” For each rubric, there are four levels (plus a “not observed” indicator) that describe implementation of the practice labeled “beginning,” “developing,” “progressing,” and “extending.” The rubrics are intended to avoid judgment for a particular teacher’s level of expertise and indicate instead, the “level of implementation” of a particular aspect of practice.

Each level of a rubric provides two to five sentence-long descriptions to guide evaluation of levels of implementation of FA practice. For example, the “beginning level” of the “Feedback Loops During Questioning,” rubric includes two descriptors: “The teacher asks none or very few questions designed to encourage classroom discourse during the lesson,” OR “The teacher asks questions from students, but discourse focuses on a statement of correct or incorrect rather than deeper/meaningful exploration of ideas.” The “extending” level of this rubric has three descriptors:

- The teacher asks questions designed to encourage classroom discourse consistently throughout the lesson and integrates questioning and discussion seamlessly into instruction.
- The teacher and students consistently build on other students’ responses, clarify student comments, push for more elaborate answers, or engage more students in thinking about the problem.
- Extended feedback loops are used to support students’ elaboration and to have students contribute to extended conversations. Classroom discourse is characterized by the consistent use of feedback/probes that encourage deeper/more meaningful exploration of ideas.

The FARROP model was developed as a set of rubrics and observation protocols and “reflection tools” to focus attention on classroom practices in formative assessment. The commitment to supporting teachers’ professional learning, particularly through peer observation and reflection on teaching practice, explains the theory of differentiated FA practice. Rigorous study of a sample of teachers and therefore validation of the internal structure of these dimensions is not yet available. But the *professional growth over time* perspective shared by these FA researchers signals a more robust commitment to the role of teachers in developing their FA practice-based repertoires, more than previous research in the field.

Recent scholarship has leaned further into the empirical quantitative study of teacher development in classroom assessment knowledge and practices (Duckor et al., 2009, 2017). To better articulate the gaps in between experts and novices in research on formative assessment practice, Duckor and Holmberg (2019) use the language of “FA Moves” to test hypotheses about empirical trajectories and progressions of high-leverage formative assessment practices. Similar to the implicit growth modeling of the FARROP rubrics, this moves-based approach emphasizes the teacher’s development, learning, and transitions toward expertise in myriad formative assessment practices across 5 “developmentally appropriate” levels of practice.

Utilizing principles of evidence-centered design (Pellegrino et al., 2001) and the conceptual framework of learning progressions, these authors envision trajectories of high-leverage formative assessment practices. The theoretical framework of construct modeling (Wilson, 2005) places emphasis on moving from listing practices or facets of formative assessment toward the aim of articulating qualitative differences in the enactment of well-defined practices along a trajectory of moves.

Rather than seek to define an exhaustive list of “dimensions” or “facets,” Duckor and Holmberg’s research draws from consensus about the foundational role of questioning practices in FA (Duckor, 2014; Duckor and Holmberg, 2017) that are developmentally appropriate for novices and beginner teachers. Duckor and Holmberg (2019, p. 847) write:

Based on a review of the assessment for learning literature and professional teaching standards documents, questioning practices are integral to the practice of preservice and in-class FA across the P-12 curriculum (Applebee et al., 2003; Ball et al., 2009; Heritage and Heritage, 2013; Jacobs et al., 2010; Ruiz-Primo and Furtak, 2006; Smith and Stein, 2011; William, 2007). To better understand these foundational, generative questioning practices, we have decomposed them into three high-leverage moves: posing, pausing, and probing within the FA moves framework. Each construct map represents a variable in the framework.

Duckor and Holmberg developed the Posing-Pausing-Probing (PPP) construct model to examine how instructional and assessment moves can be woven together along empirically verifiable dimensions of practice. A recent quantitative study of these three distinct but related FA moves among pre-service teacher candidates indicated strong evidence for reliability and validity of score interpretations (Duckor et al., 2020a,b).

The FA moves-based approach in the PPP study articulates levels of practice along a well-defined dimension; it emphasizes the teacher’s development, learning, and transitions toward expertise in formative assessment practice without judgment from an idealized norm or standard. Empirical study of teacher artifacts (i.e., video of lesson enactments on standardized licensure teacher performance assessments) has led to valid and reliable representation of trajectories in three areas: “Posing” with a range of questions; “Pausing” for wait- and think-time for responses; and “Probing” on responses for elaboration.

In Duckor and Holmberg’s approach, there are 5 levels of differentiated practice for each construct map. These are titled “pre-structural/pre-probing,” “unistructural/emergent,” “multistructural/intentional,” “strategic/purposeful,” and “differentiated/

Probing			
More ↑ ↓ Less	<i>Respondents</i> whose probing is adaptive to evidence of individual and groups of students' present understandings in relation to the intended learning target, context, and curriculum. Can explain what they anticipate to happen as a result of probing and why. They communicate concern for responding productively to student responses they cannot anticipate and can explain strategies that support eliciting and leveraging such responses in relation to learning target. They enact probes with relevant knowledge of students and learning progressions in mind. They enact ways to support students probing each other's thinking and performances. They tend to enact lessons that reflect multifaceted purposes for probing and integration of other FA moves to support probing. They tend to enact lessons that encourage student independence and interdependence related to probing and the generation and use of formative feedback. Respondents probe equally well regardless of configuration—whole class, small group, one-on-one—and consistently probe in each of these configurations during lessons.	Differentiated "adaptive"	<i>Responses to tasks/items</i> indicate patterned and responsive probing that includes productive teacher responses to information elicited by teacher and/or student probing and incorporated into further probing. Responses indicate that probing includes focus on student self-regulation of learning and that formative feedback students receive or generate is tied to data elicited from probing and linked to learning target. Observation shows productive handling of unorthodox responses to probing. Probing enacted reflects detailed and relevant knowledge of students, context, and curriculum, and may suggest use of learning progressions. Observation demonstrates a productive balance amongst probing technique/strategy, students' affective states, and learning goals and integration of other FA moves to support probing. Observation reveals configuration (whole class, small group, one-on-one) does not influence quality of probing, which is consistently done throughout the lesson, regardless of configuration.
	<i>Respondents</i> who describe the purposes motivating probes/probing moves and attend to probing's role in generating formative feedback and in supporting student agency in efforts to progress toward intended learning target. They tend to enact lessons such that instructional decision making is contingent upon what is elicited from probing. They support student-to-student (S-2-S) probing strategically and integrate other FA moves with probing. They tend to enact probing that results in responses used by students and teacher to move students' learning forward in relation to the learning target. Respondents who use other FA moves (e.g., priming, pausing, and posing) to support probing. Respondents for whom episodes of whole class probing begin to reach the probing skill levels they demonstrate during small group and one-to-one configurations, though not consistently.	Strategic "purposeful"	<i>Responses to tasks/items</i> indicate teachers take up evidence of student performance in probing formulation or delivery. A variety of probing moves are demonstrated. Observation shows that student-to-student (S-2-S) probing occurs, supported by norms, routines, and scaffolds. Observation may show "extended episodes" of probing that are on topic and on task between teacher and students and students and students. Observation suggests attention is paid to using probing to improve formative feedback related to intended learning target that is available to students by teacher and students. Responses to task/items show other FA moves (e.g., priming, pausing, and posing) are used to support probing. Observation demonstrates episodes of whole class probing beginning to reach the probing skill levels demonstrated during small group and one-to-one configurations, though not consistently.
	<i>Respondents</i> who address probing's relationship to decision making and to probing's role in making understanding and thinking visible and why this is important. Probing's role in clarifying student understanding of intended learning target, fostering student responsibility for efforts toward the target, and informing formative feedback tends to be overshadowed by other teacher goals for probing (e.g., "uncovering misconceptions", checking understanding of academic language). They tend to enact lessons that include probing of "correct answers" and that encourage S-2-S probing. They tend to enact probing that targets either catalyzing movement toward the learning target or influencing student affect. They may be challenged to capitalize on what probing elicits. Respondents whose probing is noticeably better during one-on-one and small group configurations than it is during whole class instruction.	Multistructural "intentional"	<i>Responses to tasks/items</i> indicate probing is potentially valuable to teacher or student decision making. Probes target uncovering misconceptions. Observation shows teacher, and sometimes students, using what probes make visible in attempts to advance student performance related to learning target. Observation shows probing of "correct answers", probing to uncover misconceptions and/or checking understanding of academic language. Observation demonstrates support of S-2-S probing, although explicit connections to how S-2-S probing can support student understanding of the intended learning target and student ownership of efforts toward this target may be absent. Responses may indicate "teacher probing as formative feedback to students." Observation demonstrates teacher's quality of probing during one-on-one and small group configurations is much better than it is during whole class instruction.
	<i>Respondents</i> who contend the main purposes of probing are to spur student action and to make learners' thinking more visible. They tend to rely on generic probes (e.g., "Why?" or "Please explain."). They tend to enact lessons where probing is not explicitly tied to informing possible formative feedback and enact most of their probing in one component of the lesson. Some respondents enact lessons where the wording and/or pace of probing mirrors students' needs, but the orientation of the series of probes is still primarily from the teacher's point of view. Most and/or best quality probing occurs during one-on-one or small group configurations. Respondents who are able to probe student thinking during one-on-one conversations, but not leverage this to probing well with small groups of students or during whole class configuration. Respondents tend to complexify their probing before a student responds. Some respondents may repeat or revoice student responses as probing or proto-probing.	Unistructural "emergent"	<i>Responses to tasks/items</i> indicate probing relies on generic probing moves (e.g., "Why?" "Say more..." "What do you mean?") as probes that are beyond "probing to manage" or "probing to engage." Observation shows that some probes do make some learners' present thinking somewhat visible. Observation may show that what gets elicited via probing gets used by students or teacher, but also that probing is not explicitly tied to formative feedback. Observation often reveals probes reside in a narrow range. Some responses to task/items indicate that during teaching the wording and/or pace of probing mirrors students' needs, but still is oriented primarily to the teacher's thinking. Observation shows most and/or best quality probing happens with one student and occurs during one-on-one or small group configurations and not during whole class instruction. Observation shows teachers complexify probe(s) before students respond. Some responses to task/items indicate that the teacher repeats or voices students' words as proto-probing.
	<i>Respondents</i> for whom probing student thinking related to the learning target is not a primary concern in classroom assessment. They tend to enact lessons where student discourse is not rich and where "discussions," if they occur, exemplify "coverage and review," not processes supporting "uncovering" or "elaboration" of student responses. They do not probe student thinking regardless of configuration: whole class, small group, or one-on-one.	Prestructural "pre-probing"	<i>Responses to tasks/items</i> do not plausibly indicate that probing related to the learning target has occurred. Observations of teacher to student interactions in whole class, small group, and one-on-one configurations do not suggest probing.

Fig. 4 Construct map for identifying differentiated probing practices.

adaptive." In the example of the Probing construct, the authors carefully specify levels of progress along the proposed continuum of FA practice (Fig. 4).

The nature of the complexity of a construct map makes them (a) essential to the design of sound assessments for learning FA practices, (b) useful for instructional decision making (when instructional practices for learners are linked to vetted FA construct maps) during coursework and professional development modules, and, potentially, (c) helpful in efforts aiming to integrate site-based FA instruction with wider professional accountability in teacher licensure. As Wilson (2009, p. 3) and others note, construct maps are at once general enough to be interpretable within a particular curriculum—and possibly across curricula—and specific enough to guide the development of the curriculum task designs and scoring tools/guides for an evaluation and/or observational study design.

These new directions in FA research offer significant affordances for those interested in designing measures in preservice teacher assessment and inservice evaluation settings, where individuals may not share a common preparation curriculum or standardized professional development program. Moreover, the progress guides framework aligned with corresponding construct maps operate at a grain size intended for teacher-driven, peer and self-assessment in different contexts (See, e.g., Duckor & Holmberg, in press). In addition to aiding cooperating teachers and faculty as they observe practice, like the FARROP rubrics, these PPP guides aligned with construct maps support the process of formative feedback for, by, and among teachers working toward FA expertise.

Conclusion and future directions

Everything we know about teachers and teaching teachers tells us that they, like all professionals, are learners who are working toward mastery of a craft (Grossman, 1990; Grossman et al., 2009; Shulman, 1986, 1987). The subject who is learning about formative assessment is no different than the one learning about educational psychology, language acquisition and learning theory, culturally responsive and sustaining pedagogy or any other (dis)courses of study intended to deepen teacher preparation, support on-going in-service training and ultimately broaden professional practice.

Teachers are lifelong learners on different trajectories, much like their students; teachers, too, are apprentices, often learning with guidance and support from more knowledgeable others in the profession. Teachers' locations in particular preparation pathways, induction programs and professional development efforts are only part of a story of teacher growth. Assessment practices, routines, and procedures cut across many contexts for life-long learning. When it comes to developing expertise in formative assessment practices, we need to locate how these FA practices evolve, cohere, and ultimately become, as Vygotsky might note, internalized automatically within a learning environment.

Research on teachers and teaching has shown that formative assessment can improve student learning more than most instructional practices (Hattie, 2009, 2012). Empirical evidence spanning nearly three decades indicates that thoughtfully implemented formative assessment practices improve students' learning, yet little research work has been done on the actual development of teachers-as-formative-assessors as they learn to take up high-leverage practices in the domain of classroom-based assessment for learning across myriad subject disciplines in K-12 education.

New developments in FA research are exploring implications of teachers becoming formative assessors from pre- and in-service classroom perspectives, in part, by centering research on how high-leverage instructional and assessment moves can be modeled for study. The concept of "dimensions" or "levels" and "facets" in formative assessment requires technical evidence and must rest upon a developmental foundation. When one approaches how to model teachers' learning progressions or hypothesize trajectories of practices in the domain of formative assessment, qualitative study of "aspects" "moves" and "strategies" are at the root of deeper inquiry. Theory can only be built from the firm foundation of observational study and lived experience in the FA realm across the spectrum of teacher-learners—from those engaged in novice to expert practices, and all those emerging in between.

Stake (1967) presciently noted that, while evolving over nearly over a half century, the evaluation and by implication the assessment field has blindspots. Teachers' work, which includes their own learning and development, has always been the black box for those who fail to appreciate contingencies. Stake wrote:

Lesson planning and curriculum revision through the years has been built upon faith in certain contingencies. Day to day, the master teacher arranges his presentation and selects his input materials to fit his instructional goals. For him the contingencies, in the main, are logical, intuitive, and supported by a history of satisfactions and endorsements. Even the master teacher and certainly less-experienced teachers need to bring their intuited contingencies under the scrutiny of appropriate juries (pp. 528–529).

The question before the new assessment theorists and for those who study teachers in their full range of capacities, dispositions, orientations, and most importantly, personal trajectories of practice over a professional career is: Can we study and honor contingency while hypothesizing growth and respecting the teacher-as-learner of effective classroom assessment practices? Our teachers' need for visible scaffolds, structured feedback, and focused attention on "just-in-time" goals is ubiquitous and necessary. What is wanted for students is needed for teachers and vice-versa.

The lived, evolving, often messy practice of formative assessment—for students and teachers alike—has been largely ignored in the search for expertise and exemplars of formative assessment in the classroom over the past three decades. Without conceptual frameworks rooted in learning theory for teachers and students, the field labors to define accessible pathways, to identify proximal trajectories, and to empirically instantiate visible progress markers that honor incremental success. It may have been convenient for a season to remain agnostic about "how teachers learn" in the domain of formative assessment but that privileged perspective is untenable for those committed to novices, beginners, and most all of those teachers working to become formative assessors in today's culturally, ethnically, economically, and linguistically diverse learning environments.

Introduction

This chapter contributes to this volume on teachers' lives, work, and professional preparation in two ways. First, it provides a brief summary of the contemporary literature concerned with research and practice in professional development in early childhood education. Second, it offers a critique of this literature, specifically in the context of a globally mobile early childhood education workforce. Such critique is essential if educational institutions serving our youngest citizens are to recognize and value the diverse knowledges and cultural forms of *all* children and their families. In recent decades the emphasis of early childhood education policy around the world has turned to raising the quality of programs for children and their families, with attendant policy frameworks and professional development opportunities. Our overall aim is to argue for a thorough conceptualization of the nexus between professional development and quality in early childhood education in the context of a globalized and highly diverse early childhood workforce. We base this argument on a critique of the ways in which professional development has been conceptualized to date in early childhood education research and practice, and the failure of professional development policies, programs, and research to adequately address the diversity of the early childhood education workforce. We propose that addressing this gap is likely to benefit all professionals in early childhood education and the communities they serve.

We begin by explaining how the term "professional development" has typically been understood as a direct process of acquiring and developing a universal set of knowledge and skills competencies required to produce a desired set of outcomes in the early childhood education field. It is only since around 2015 that the empirical literature on early childhood educators' professional development has made a serious attempt to move away from the quest to identify effective professional development principles and program designs, and toward a more robust conceptualization of professional development as being anchored in educators' *learning*. We argue this is a necessary shift, although the number of studies since 2015 that attempt to conceptualize and theorize professional development in early childhood education still remains small. We provide evidence for this argument by examining some of the research into early childhood educators' professional development published since 2010, with a particular emphasis on professional development initiatives linked to program quality improvement. This focus and timespan are both deliberate. As we note above, many countries are now investing heavily in building the capacity of their early childhood education workforces with the aim of increasing the quality of care and education programs. Much of the literature in the decade since 2010 is, therefore, tightly situated in the relationship between professional development and concepts of quality in the provision of early childhood education and care.

We then turn to the way in which early childhood educators form part of the culturally diverse, globally mobile, and overwhelmingly female workforce that comprises the caring professions. Yet the expertise, needs, and aspirations of these early childhood educators are curiously absent from the professional development literature. In the final part of the chapter we draw together our threads of professional development, early childhood program quality, educator diversity, and workforce mobility to argue the need for new and robust theoretical underpinnings to inform the professional development opportunities necessary for all educators—migrant educators and their local colleagues alike—in the coming decades.

How professional development is understood in early childhood education

Systematic programs of professional development are a relatively new phenomenon in early childhood education internationally. In part, this is because work is still being done in many countries to establish a workforce that holds even baseline qualifications. In

schools around the world, teachers typically hold a minimum locally required credential prior to their classroom employment, but this is not the case in early childhood education and care (OECD, 2019). In Singapore, for instance, even though minimal professional qualifications are stipulated for its largely privatized childcare and kindergarten sector—10 years of formal education and an accredited professional certificate-level or diploma-level course—these expectations are significantly less compared to the undergraduate degree requirement imposed on primary school teachers in the public school system. And in Singapore, as well as in other so-called advanced economies such as Australia, concerted efforts are still needed to recruit, educate, and retain a suitably qualified workforce (Australian Children's Education and Care Quality Authority [ACECQA], 2021). We suggest this lack of a universal qualifications base is one reason why discourses of professional development in early childhood education are also less developed when compared with the schools sector.

As evidence of this relative lack of maturity, we point to a problematic feature of attempts to conceptualize professional development in early childhood education, both in research and in practice: the way professional *development* has been defined as professional development *activities* rather than as the *learning* that is necessary to develop practice. For example, in the US the National Association for the Education of Young Children [NAEYC] defines professional development as "... a continuum of learning and support *activities* designed to prepare individuals for work with and on behalf of young children and their families, as well as ongoing *experiences* to enhance this work" (NAEYC, 2022, n. p., emphasis added). Over a decade ago, Buysse et al. (2009) argued that the early childhood field needed to develop authoritative definitions of what constitutes professional development and that, without these, the field lacked "a common vision for the most effective ways of organizing and implementing professional development to improve the quality of the early childhood workforce" (pp. 235–6). However, in their attempts to define professional development, Buysse, et al. also misrecognize professional development activities as development itself:

The term *professional development* encompasses all types of facilitated learning opportunities, for example, those that result in college credit or degrees as well as those that generally are less intensive and do not yield credits or degrees, those that occur largely through formal coursework, and those that are more informal and situated in practice.

Buysse et al. (2009, p. 238, emphasis in original).

Within the same decade, Winton et al. (2016) proposed rethinking professional development in early childhood education as *learning*, in the light of challenges such as a lack of common definition about what constituted professional development and, consequently, the lack of coherent professional development systems and practices within a fragmented early childhood education landscape in the US. These authors believed that a unifying definition could promote clarity and alignment, proposing a broad definition of professional development as "facilitated teaching and learning experiences that are transactional and designed to support the acquisition of professional knowledge, skills and dispositions as well as the application of this knowledge in practice (Winton et al., 2008, p. 3)". In their 2018 meta-analysis of the relationship between professional development, quality ratings, and child outcomes, Egert, Fukkink, and Eckhardt also hint at a potential shift toward conceptualizing professional development as learning in early childhood education. They argue that "teacher outcomes" of effective professional development should comprise *awareness, orientations, knowledge, competencies, and performance* (Egert et al., 2018, p. 405). However, their analysis of professional development research suggests that evidence of the ways in which educators actually learn awareness, orientations, knowledge, competencies, and performance through professional development activities is still a "missing link" in the early childhood field. In the absence of a robust conceptualization of professional development, professional development research in early childhood education still largely relies on an assumption of a teleological (though not causal) link between professional development interventions (activities) and children's learning (outcomes), often via the category of "improved early childhood program quality." This assumption, in turn, is likely to be a consequence of policy settings (with attendant research funding) that focus on child outcomes, without first conceptualizing exactly *how* educators learn.

For the purposes of this chapter, we propose a definition of early childhood professional development that we believe has the potential to guide its conceptualization as *the learning that necessarily precedes development*. We suggest: *early childhood individual and collective professional development is a consequence of learning that fosters changes in educators' practical, cultural, and psychological grasp of their work, in ways that enhance their lives as well as the lives of children and families*. We return to this definition later in the chapter alongside calls by other scholars for the identification of promising concepts to explain early childhood educators' development and guide the activities that can foster the learning that necessarily precedes such development. Before doing so, we turn to a brief precis of the early childhood professional development research literature.

The early childhood education professional development research literature

Both the scope and scale of the professional development research literature in early childhood education are now considerable—in an initial search for their meta-synthesis of this literature, Brown and Englehardt (2016) found 974 peer-reviewed qualitative studies in the US alone—so a thorough review of the international literature is beyond the scope of this chapter. However, broadly speaking, this literature has a strong focus on evaluation of professional development program effectiveness, often with the aim

of identifying principles and practices to support effectiveness. This is unsurprising given the recency of regular professional development as an established phenomenon in the early childhood field. Since 2015 several scholars have capitalized on the size of the effectiveness literature to undertake meta-analysis and systematic review. In addition to Brown and Englehardt's (2016) meta-synthesis of qualitative studies in the US, Jensen and Iannone (2018) have undertaken a comparative review across ten EU member countries; Schachter et al. (2019) have reviewed US studies of effective professional development programs to identify their distinguishing features; and Peleman et al. (2018) have conducted a systematic review of primary research studies across 28 EU member nations, also with a view to identifying the features of successful programs.

Although the major analyses of the literature we cite above are confined to the US and EU, the geographical scope of the effectiveness literature is broad including, for example, Wolf et al. (2019) evaluation of the *Quality Preschool for Ghana* professional development program; He and Ho's (2013) study of the policy|teacher development interface in Hong Kong; Mendive et al. (2016) study of intervention fidelity in an early literacy professional development program in Chile; Nolan and Molla's (2018) study of coaching effectiveness in Australia; and Machado's (2019) study of practice development in a center in Portugal. Data generation and analysis methods are similarly wide in scope across these studies. These include case accounts (e.g. Machado, 2019; Inglis and Brown, 2013); video analysis (e.g. Harkoma et al., 2021; Mendive et al., 2016); interviews and focus groups (e.g. Nolan and Molla, 2018); standardized instruments for measuring teacher-child interaction (e.g. Torres et al., 2021; Eadie et al., 2019); and mixed methods (e.g. Linder et al., 2016). A further rich aspect of this literature is the wide range of content foci across the reported professional development programs. These foci comprise the whole range of entry points through which to understand early childhood education, including individual curriculum domains (e.g. literacy, mathematics, science); work with specific age groups (e.g. infants and toddlers; transition to school); approaches to assessment and documentation; work with families; and leadership and management.

Despite the heterogeneity of this large corpus of effectiveness studies, it is possible to identify two distinctive sub-sets within this literature. The first relates to evidence of shifts in the quality of educators' interactions with children following professional development interventions. Again, this focus is unsurprising given the intensely relational nature of teaching young children, the persuasive evidence for the relationship between classroom interaction quality and children's learning, and the interest taken by psychologists as well as educationalists in children's language development. This sub-set frequently overlaps with the second sub-set, which examines the relationship between the professional development of educators and consequential shifts in program quality. As stated at the outset, it is this relationship that we seek to critique in this chapter in the context of the diversity and global mobility of the early childhood education workforce.

Researching the relationship between professional development and program quality

Recent decades have seen a sociohistorical era in which teachers across all sectors of education and in many countries have been positioned as instruments of policy implementation who are directly accountable for children's learning outcomes, rather than as learners in their own right. With reference to the schools sector, Down (2012) calls this positioning "technical instrumentalism" (p. 65), and Angus (2012) attributes this positioning to "the current economic framing of education, in which the education policy framework has become narrow and instrumental, and principals, teachers and, most importantly, students, in keeping with a technical/managerial perspective, are treated as objects of policy" (2012, p. 50). It is not surprising, therefore, that a second distinctive sub-set of the early childhood professional development literature examines the effectiveness of professional development interventions in the context of policy mandates to improve the quality of early childhood programs.

The studies in this "professional-development-for-quality" sub-set typically invoke specific national and supra-national policies. For example, Jensen and Iannone (2018) reviewed early childhood professional development research across ten EU countries, focusing on the concept of early childhood system innovation and its relationship to quality outcomes, in response to the EU's *Europe 2020, a strategy for smart, sustainable and inclusive growth* (European Commission, 2010). Similarly, Peleman et al. (2018) made a systematic review of primary research studies across 28 EU countries, finding that long-term interventions that are well-integrated into center practice are effective, even in national early childhood policy contexts where services are poorly subsidized and have low rates of educator qualifications. Both of these EU studies point to cross-national policies in Europe as a driver of research into the relationship between professional development and early childhood program quality. In Australia, Barber et al. (2014) analyzed professional development opportunities and foci relative to Australia's *National Quality Standard* [NQS] (2012/2018), the policy statement against which mandatory assessment of center quality is made by Australian governments. Even when studies in this sub-set are anchored in state-level policies, such as Ton-yan et al. (2017) study of family childcare providers' engagement in quality improvement initiatives in California, supra-national policies and the influential research studies that have shaped these policies are often cited. These influential studies include the economic analyses of Heckman and colleagues (Heckman, 2011; Campbell et al., 2014), work on teacher-child interaction as a key variable in center quality (e.g. Sylva et al., 2004), and long-standing insights into the relationship between early childhood education participation and children's subsequent social and academic achievement (e.g. Schweinhart and Weikart, 1997).

Many national early childhood policies also seek to address social inequalities, including the overlap between inequality and cultural diversity. In Singapore, for example, the recognition that culturally diverse children have greater academic success if they retain their home language, as well as speaking the language of instruction, is embedded in education policy. This is reflected in early childhood settings through provision of educators who can teach in children's "mother tongue" (Ng, 2014). Pathways for educators to temporarily migrate from China and elsewhere to provide early childhood education in home languages are correspondingly built into Singapore's migration policies. In the EU context, Jensen and Iannone (2018) also point to why understanding children's diverse cultural contexts is important:

One important argument for considering CPD is to strengthen professionals beyond their pre-service training in their ongoing work towards high quality ECEC (Zaslow, 2009). Another addresses professionals' need to take an active part in creating and implementing culturally-specific goals for ECEC in ways that take into account different contexts of child development, including a wider context of society, reflecting the views of children as active learners (UN General Assembly, 1989), the values of families, later school requirements and the interests of society (European Commission, 2010), also in terms of social inequality and issues regarding the vulnerable (p. 24).

However, in proposing these arguments Jensen and Iannone (op. cit.) repeat the teleological assumption at the heart of much contemporary international early childhood education policy (and therefore at the heart of many accompanying professional development initiatives): that the purpose of professional development of educators is to improve their knowledge, skills, and attitudes *so that* early childhood education services improve. We suggest this is a necessary—but insufficient—rationale for the professional development of early childhood educators. Not only does this rationale fail to take early childhood educators into account as learners in their own right, it also neglects the rich resources that educators bring to the professional development process.

It also assumes that educator learning involves a technicist "input-output process," a view which has already been challenged in research outside of early childhood education in studies examining novice and experienced schoolteachers' sense-making (e.g. Clarke and Hollingsworth, 2002), teachers' emotions (e.g. Zembylas, 2011), and teacher agency (e.g. Vähäsantanen et al., 2008). Teachers' sense-making has been defined as an interaction between teachers' understandings of situational demands and their personal frames of reference, often intertwined with their feelings of being recognized or valued. Emotions are yet another fluid dimension of teaching and learning that has been found to be highly influential in teachers' professional learning, with consequences for their practices and interpretations of school reform and their understandings of power structures in schools and society (Zembylas, 2011).

Educators are notably absent from the professional-development-for-quality-improvement literature, except as sources of research data. In other words, in treating activities and outcomes as the main units of analysis for research into professional development, the professional expertise of the people who are supposed to be "developing" is rendered largely invisible. Brown and Englehardt (2016) have likewise argued that research into early childhood professional development has paid insufficient attention to educators and how educators make sense of the context-specific features for their work:

While important and informative, this empirical focus on what changes teachers' practices and/or improves children's development and learning provides limited insight into ECE PD. Missing from these analyses is an understanding of the nature of the PD sessions themselves, the teachers' experiences within these PD programs, the contexts in which the teachers work, or the impact of these PD programs on teachers' conceptions of instruction or themselves as teachers (p. 217).

We concur with this claim, but suggest there is a further weakness in the early childhood professional development literature that cannot be addressed simply by incorporating the lived experiences of educators. Background theoretical concepts related to learning and development are also absent. As we noted earlier, professional development, at least as it is defined by authoritative sources such as the NAEYC, by Buysse et al. (2009) and by Egert et al. (2018), is comprised of inputs (activities, opportunities, experiences) and outcomes (either for children or as empirical measures of program quality that stand as proxies for child outcomes). A shortcoming of this definition is that it neither employs nor develops conceptual frameworks with the potential to explain *what* professional development is in early childhood education. The identification of principles and practices of program design that has characterized research to date fails to explain how early childhood educators *learn in order to develop* in the specific contexts of early childhood education services. We agree with Brown and Englehardt (2016) when they say,

What appears to be missing from this literature is a clear understanding of how researchers frame the knowledge and skills of practicing early educators, what sets of knowledge and skills researchers think are most important for improving early educators' teaching, and what researchers see as being the best practices for delivering these sets of knowledge and skills to practicing early educators (p. 220).

Without the incorporation of strong conceptual frameworks and background theories of learning, claims about principles and practices will continue to be derived from the features of existing programs (e.g. the length of interventions; the choice of intervention methodologies, such as action research; individual vs. center-based programs; etc.). This approach presents the serious risk that claims about how effective programs *should be* designed are derived from how programs are *already* designed. In the final section of this chapter, we argue for inclusion of concepts drawn from learning and development within and across diverse cultures to address the need for a strong conceptual basis for early childhood educator professional development in the interests of program quality for children and families. Before doing so, we contextualize this argument by describing the globally mobility and diversity of the early childhood education workforce.

Diversity and global mobility in the early childhood education workforce

Early childhood educators are one of three main groups that form the international care workforce (the others being aged care workers and personal care workers). A fourth major group of similarly gendered (female) migrant workers is comprised of domestic workers in private homes. As Sheehan (2017) explains, “In light of growing international demand for child and senior care givers and the ongoing entry of women in developed nations into the professional labor market, domestic labor markers often look toward global labor pools to fill positions” (p. 314). In early childhood education, this reorientation has also been marked by a shift across time away from traditional sources of migrant educators by developed nations. In Australia before 1976, for example, 48% of Australia’s migrant care workforce was drawn from the UK; by 2016, 48% of this migrant workforce was from Southern Asia (35%) and Maritime South East Asia (13%) combined, with 28% of these workers coming from non-main English-speaking countries (Eastman et al., 2018). With specific reference to early childhood education, by 2016 approximately 35% of Australia’s childcare workforce was born outside Australia. In Singapore too, even as its early childhood sector continues to expand amid a shortage of locally trained educators, current labor laws potentially allow about a third of its early childhood workforce to be made up of migrant educators. Based on anecdotal evidence, we know that many migrant educators hold short-term (2-year) work visas and have moved from the neighboring ASEAN countries and the Peoples’ Republic of China.

Given the scale of global migration in care work, it is remarkable that so little attention has been paid to the learning needs of migrant workers in early childhood education, especially considering the wealth of literature on work with migrant children and families. Recently, Quintero et al. (2021) have argued for the convergence of leadership, teacher education, early childhood education, migration, and storytelling in the preparation of all early childhood educators, particularly those who are refugees or migrants. But how and why do these educators join the workforce in the first place? What are their professional learning needs? And how do they contribute to early childhood program quality? These too are “missing links” in early childhood education and teacher education research.

To inform the best ways to support diverse educators for contemporary early childhood education, the early childhood field needs to know more about basic phenomena such *who* these diverse educators are and *why* they have chosen to (a) migrate and/or (b) join the early childhood education and care profession. Here we deliberately situate this question as a and/or problem. This is because some migrant educators are already early childhood professionals in their country of origin and migrate via dedicated immigration pathways (as noted earlier, Singapore is one example of this approach); while other countries mainly rely on individuals who enter the country via other migration pathways then make a career change from their original profession into early childhood education. Australia is a notable example of the latter approach, having no dedicated migration pathway for early childhood professionals; only center managers and childcare group leaders (with the required qualification and at least 1 year of experience in a regulated early childhood service) are eligible for migration assessment (Australian Department of Home Affairs, 2021). This approach of relying mainly on migrants making a career switch to early childhood education post-migration results in a rich mix of experience among migrant educators; in their interviews with migrant women who had become early childhood educators after migrating to Australia, Hamilton et al. (2021) found a range of prior qualifications and work experience including journalism, pharmacy, midwifery, chemistry, and social work. However, even if migrant educators were already qualified early childhood teachers in their country of origin, systematic yet holistic support is needed to help them develop a sense of belonging, re-situate and strengthen their identities as professionals in a new cultural context, make sense of their own professional learning sufficiently to exercise teacher agency (Beijaard and Meijer, 2017), and respond to the professional norms, curricular frameworks, and cultural expectations around children, early childhood education, and parenting in their destination country.

Supporting the learning of a diverse and globally mobile early childhood education workforce

Although there is a considerable literature on the effectiveness of professional development for work with diverse children (see Bottiani, 2017) for a systematic review of this literature in school settings), as yet there is almost no literature that considers the learning needs of diverse educators. Beyond understanding the profile and motives of migrant early childhood educators, researchers need to find ways to systematically identify the expertise these educators bring from their countries of origin. This expertise includes the

range of ways in which “early childhood program quality” is conceptualized across families from diverse cultural backgrounds. In keeping with our argument in this chapter, this empirical work should be guided by background theories of learning and development that take cultural differences into account. Even without this research, we suggest there is a need to support migrant educators in their transition to working in their destination countries. However, such programs must not themselves rest on normative assumptions, i.e. that early childhood programs in destination countries are framed around “best practice” so it is the task of migrant educators to adapt and enculturate themselves to local definitions of quality in early childhood programs. We also point to the need for *local* educators in destination countries to learn to recognize and value the rich professional and cultural knowledges that can be contributed by migrant educators, and know how to mobilize these knowledges in the interests of children and families. If such programs position migrant educators as “the other,” they will not only perpetuate structural racism but perpetuate the neglect of the expertise of *all* educators we have detected in our analysis of early childhood quality policies in East Asia (Nuttall et al., 2021).

We see considerable potential in theories of learning and development developed within and across diverse cultures to address the need for robust conceptualization of professional development in early childhood education. But any call for such a conceptualization is not neutral. There is now considerable evidence for the ways in which normative (i.e. race-based) assumptions of development obscure the valuable knowledges and cultural practices of diverse children and families, with inequitable consequences for their communities (Delpit, 2002) and negative impacts on child health (Trent et al., 2019). Theorization of professional development as well as quality in early childhood education should therefore reach beyond theories of learning and development anchored in traditional developmental psychology. Instead, researchers need to develop framings that understand educator learning as embodied and relational (Cekaite and Bergnehr, 2018), gendered, classed, and raced (Wright, 2011) and context-bound (Gomez et al., 2015)—concepts it is impossible to ignore when paying attention to the work educators actually do in early childhood education. These theorizations should be complemented by use of theories that explain the systemic factors that marginalize women and migrants, such as critical race theory, sociohistorical theory, feminist economic theories, and theories developed by First Nations scholars and in the global south. It is through engagement with such background theoretical frameworks that more culturally nuanced, and therefore more representative, principles and practices of quality improvement in early childhood education can be developed. We suggest such theorization of professional development *as learning* would benefit all early childhood professionals, not just migrant educators.

Conclusion

In this chapter we have critiqued the neglect of educators’ lived experiences and expertise in early childhood professional development research and argued that this is characteristic of the studies conducted during the last 10–20 years, when governments around the world have attempted to strengthen early childhood system and center quality. We have also suggested that, by conducting professional development research within the policy|quality nexus, a closed instrumental loop—research influencing policy influencing research—educators’ expertise and needs are sidelined. Culturally diverse educators are a particular omission from this research; in our analysis of the early childhood professional development research we were unable to find any studies of professional development specifically for diverse educators. Despite attempts by policymakers to increase program quality in the interests of diverse and marginalized children and families, culturally diverse educators remain “missing in action” in the early childhood professional development research. The neglect of their learning, as well as the failure to mobilize their expertise, seems an illogical oversight in the context of increasing global mobility and diversity, as well as the need to develop rich understandings of early childhood program quality.

We have also pointed to the absence of robust theorizing within early childhood professional development research to date. Although there have been some attempts since 2015 to identify concepts that might assist researchers to describe and analyze the complex nature of adult learning and development in early childhood education, and allow educators to connect their learning to desired outcomes in their work, there has been limited progress. Two bodies of theory suggest themselves as obvious starting points: developmental theory derived from cross-cultural understandings; and sociological and other theories with explanatory power for diverse educational contexts. Only then will it be possible to understand how educators develop in early childhood education and, therefore, how truly effective professional development for quality improvement should be designed. We have argued for a definition of professional development anchored in educators’ learning as the necessary starting point for this work.

Introduction

This essay discusses the relation between the global, regional, and local contexts of policymaking in education as observed in the two contrasting cases of teacher education in England and France. This is done by drawing on existing academic literature, and empirical examples drawn from research conducted as part of the TeachersCareers project¹ (see Helgetun, 2021 for an in-depth presentation of the research methodology that informed the discussion presented here), to construct a socio-historical narrative. The literature was identified based on a systematic literature reviews on the topic of teacher policy (Sørensen and Dumay, 2021) conducted within the project, as well as discussions with leading authors in the field in both England and France. Due to the format, some of the information presented here is brief, however, sources are provided should the reader desire to read further about for example teacher education provision and policymaking in England and France. As such, this essay can be seen as providing an overview of, and entry point for, scholars who desire further knowledge on the interaction between the global and the local.

The importance of such contrasting analysis of teacher education policy and policymaking rests in how teachers are arguably the central component of education regardless of if their role is to transfer knowledge or enable children to learn throughout their life (Brisard, 2002). Moreover, what teachers know and how they perceive their roles is rooted in the teacher's professional education and training (Beck and Young, 2005; Beck, 2009), which is shaped by policymakers (Foster, 1999; Brisard, 2002). Policymakers here refer to individuals that make de facto rules that govern the practices of others. At a state level, these individuals are usually elected officials such as politicians and/or public administrators such as civil servants. Policy on teacher education is in turn influenced by stakeholders such as teaching professionals, teacher education providers (UNESCO, 2005), or researchers (Helgetun and Menter, 2020), and reflect beliefs in a society (Menter, 2016; Tatto et al., 2016). As the discussion here shows, teacher education policymaking is largely influenced by local contexts as well as global trends, reminiscent of what Maroy et al. (2016) called a form of vernacular globalization. These developments are then discussed in relation to European integration theories, rarely used in analysis of policy and policymaking in education. What is further argued here is that globalization is nothing new, but that the form global communication takes, and as such its impact, has changed over the past centuries due to technological innovations.

To present the context and relevance of the discussion: Internationally, academic research has shown an ongoing convergence of societal beliefs on what education ought to do (Meyer et al., 1997; Schofer and Meyer, 2005; Meyer and Benavot, 2013) as well as a rise of what has been dubbed a global policy space in education (Lingard and Rawolle, 2011). Concurrently, solutions to perceived issues in teacher education have been found to be increasingly solved through policy borrowing (Steiner-Khamsi, 2010), particularly from high performers in PISA (Chung, 2016). Furthermore, education, as other aspects of public policy, is increasingly dominated by New Public Management (NPM) type policies all over the world (Hartley, 2003; Steiner-Khamsi and Stolpe, 2006; Addey et al., 2017; Dupriez and Cattonar, 2018). However, what teacher education policy is enacted and for what purpose, has been found to differ between countries and reflect the socio-cultural and historic particularities in them (Brisard, 2002). For example, France has since 1989 gone toward a university based model of teacher education provision (Sacilotto-Vasylenko and Fave-Bonnet, 2011; Prost, 2014), while England has since 1984 moved in the opposite direction from academia toward a school-led system (Furlong, 2013; Whiting et al., 2018). In England this has been addressed as a "turn to the practical" (Childs and Menter, 2013; Quirk-Marku and Hulme, 2017), while in France the trends since 1989 are seen as a form of "universitification" of teacher education (Misra, 2014; Farges, 2017). Thus, two contrasting trajectories can be observed in England and France, the former centered on an increasing role for the school, the latter on an increasing role for the university that is happening in spite of any global convergence, the Bologna process, or EU initiatives in relation to education (Helgetun, 2021). The national trajectories are here interesting in the sense that

¹See www.teacherscareers.eu.

they tell us something about the societal views on what a teacher is and what their job in the society is as expressed in different education and training models for teachers.

The next section discusses the global context from the Age of Enlightenment to PISA and TALIS, then the regional context of Bologna and the EU is presented, before the following section discusses the local contexts of England and France and how they relate to the global and regional contexts. The essay then presents a case for analyzing teacher education policy through a liberal inter-governmentalist lens (Moravcsik, 1993) before concluding remarks are provided.

The global context: from the age of enlightenment to PISA and TALIS

Different as their approaches to teacher education today are, in historic terms educational developments in both England and France as understood today originated in the Age of Enlightenment, which one may claim began with the Peace of Westphalia in 1648 and lasted until the Congress of Vienna in 1814/15. An era which laid most of the intellectual foundations for later developments in education (Tröhler, 2020). Meanwhile, the work of intellectuals such as Locke, Montesquieu, Rousseau, and Voltaire was disseminated across the Euro-centric world with an impact on how both early modern nation-states and education were conceived and constructed (Paine, 1995; Anderson, 2006; Tröhler, 2014, 2020). The Euro-centric world is here taken to mean places reached by the Nations of Europe, be it the Americas, Australia, or India. This arguably makes historical divergences, and the trajectories of socio-cultural peculiarities in the two cases as they engage with “borderless” ideas of the enlightenment, particularly interesting. For example, Jean-Jacques Rousseau’s work “*Émile, or on education*” was immediately translated from French to English upon its publication in 1762 (Rosenberg, 1981) and served as an inspiration for educational developments in both France and England, particularly through impacting on how people thought and talked about education (Morley, 1878). Meanwhile, due to the Age of Empire, the ideas of India were for example introduced to England and vice-versa (Alexander, 2001). As such, historically ideas have been hard to contain within artificial state borders, as they are disseminated by the exchange of people and literature across large distances and between diverse societies. In more recent times, this can for example be seen in how across time both England and France have engaged with remarkably similar ideas of progressive versus traditional education, such as the concept of “new mathematics” in the 1960s and 70s, or had to confront the complex opposition between practice based teacher training and academia centered teacher education that go back over 100 years in both cases (Helgetun, 2021).

The last several decades have seen the birth of different comparative approaches from the OECD’s PISA comparing student performance and well-being in schools (Ydesen, 2019), the International Association for the Evaluation of Educational Achievements (IEA) TIMSS measuring mathematics performance, as well as Eurydice presenting comparative overviews of countries education and teacher education systems (Akiba, 2017), that can be traced back (at least) to measures taken in the West following the Sputnik shock in 1957 (Tröhler, 2013). These new approaches employ mostly large-scale data sets but also qualitative measures such as the United Nation’s goal of education for all (Lingard and Rawolle, 2011; Fazekas and Burns, 2012; Robertson, 2012; Normand, 2013; Sellar and Lingard, 2013). This constitutes a major shift from the past, where ideas and ideations such as the work of Rousseau, Locke, or Montesquieu, that all affected the early global construction of the state and education, were spread by individual intellectuals rather than multi-national organizations.

What is common between today and the 18th century is a broad dissemination of ideas on education; what has shifted is the mode of dissemination (particularly speed and reach in a population) and the type of “evidence” used to support ideas on education. For example, Rousseau’s “*Émile*” has a distinctly different form of discourse than the OECD’s PISA reports. PISA, as the rest of the work of the OECD, is highly focused on measurement and statistical data, with the purpose of education framed under the mantra of a “knowledge based economy” (Godin, 2006), while *Émile* focuses on the nature of education and the nature of man to philosophize on the education of an ideal citizen. As such, they constitute two distinct “cognitive blueprints” in their own right, but also reflect fundamentally different views on the purpose of education. A cognitive blueprint is in short a structuring idea causing through mimesis (imperfect copying of a blueprint) institutionalized beliefs in something being “what works” (best practice) and therefore being what should be done (Zapp et al., 2018a,b; Helgetun and Dumay, 2021). For example, the work of Dewey—as a cognitive blueprint—has arguably fostered a belief in learning by doing, or PISA rankings and reports has fostered a belief in the Finnish model of teacher education as “best.”

In relation to teacher Education policy in the mid to late 20th century and early 21st century, global trends that have been observed are copying of high performing, mostly as measured in the OECD’s PISA and IEA’s TIMSS surveys, countries approaches to educating teachers, particularly the Finnish and Singaporean models (Steiner-Khamisi, 2010; Chung et al., 2012; Furlong, 2013; Sellar and Lingard, 2014; Chung, 2016; Adamson et al., 2017; Steiner-Khamisi et al., 2019).

In more recent years, the OECD has also begun a more targeted approach to understanding teacher’s work and their education through the Teaching and Learning International Survey (TALIS) program, the first round was in 2008, with new methodologies compared to past surveys (see Akiba, 2017), which may be argued to derive legitimacy from claims of “knowledge sharing” and listening to teachers (Sørensen, 2016). Meanwhile, the IEA launched the Teacher Education and Development Study—Mathematics (TEDS-M) in 2008 (same year as TALIS) to compare how different countries prepare their teachers to teach math’s (Akiba, 2017). It has also been argued that not all countries participated in TEDS-M under the belief that TALIS would cover the same things (so TALIS would suffice), this is reportedly not the case as TALIS and TEDS-M are distinct (Tatto, 2011). In either case, the goal of these programs is in essence to figure out “what works” in education and disseminate the results (Akiba, 2017; Tatto, 2011; Zapp, 2020). Furthermore, these new surveys of TALIS and TEDS-M may also become a political tool alongside such existing surveys as PISA and

TIMMS in new forms of education governance, centered on cultural capital and ideas more so than traditional hierarchies anchored in a legal framework (Steiner-Khamsi, 2010; Chung, 2016; Akiba, 2017).

The use of international surveys and reports to influence policymaking has been further helped along by what is reported to be an increasing network of global actors in education and teacher education (Ball and Junemann, 2012; Ball, 2016), that has emerged since the 1950s. With this increase of transnational actors, Resnik (2006) argued that international organizations have become agents in a global education arena where they act as producers of a global educational culture.

In this paradigm centered on a global or globalizing educational culture and rise in international organizations influence in education, “public” actors such as the OECD, UNESCO, and the EU, as well as “private” actors such as McKinsey, ARK, and even historically defense oriented organizations such as RAND and Defense Advanced Research Project Agency (DARPA) attempt to influence how teachers should be educated mainly through diffusing scripts of “what works,” and are reported to have the ears of people in high places (Saunders, 2007; Alexander, 2010; Coffield, 2012; Tröhler, 2013). In other words, teacher education is becoming a global policy area, where both public and private national and international actors alike contest practices and propose solutions to problems. The socio-cultural convergence, driven by IOs such as the OECD, is argued to constitute global normative, economic, and cultural pressure to adopt certain standardized approaches to education, in what has been deemed a globalizing world (Meyer and Ramirez, 2007; Zapp, 2020).

The regional context: Bologna and the European Union: attempts to harmonize teacher education in Europe

Any socio-cultural convergence in Europe today is arguably driven in part by structural harmonization attempts, primarily the Bologna process and European Union (EU) interference in education, as this section will explore.

The 1999 Bologna accord and subsequent Bologna process has sought to unify degrees across signatories, and harmonize on the 3 + 2 + 3 structure and the European Credit Transfer and Accumulation System (ECTS) where one academic year equals 60 credits. The accord was signed by both England and France, and arguably has implications for teacher education, which one may characterize today as tertiary education in both England and France. It has been observed that the Bologna process has led to convergence in higher education policy across signatory countries, and to a lesser extent also to non-signatories (Vögtle et al., 2011). Here it is important to keep in mind that general convergence in the abstract, does not automatically equate to concrete convergence in the specific. For example, teacher education *may* be loosely coupled (see (Elken and Vukasovic, 2019) for a discussion on the “loosely defined” concept of loose coupling) or de-coupled (see (Bromley and Powell, 2012) for an update of the concept, that includes not only policy-practice de-coupling but also means-end de-couplings) from higher education as a whole. Or, de-coupling may happen between different levels of policy through a form of two-level games (Putnam, 1988), thereby explaining why some countries, institutions and disciplines converge and others do not. To clarify, two-level games relates to when international considerations may dictate domestic policy and vice-versa. A de-coupling between levels would then be if one form of discourse and even policy as text is adopted at one level, but never implemented in another. In other words, the Bologna accord may become de-coupled due to a lack of national implementation in the context of practice.

Another harmonizing force is in education touching on our two cases is arguably the EU. To provide a caveat, England left the EU in 2020, however they were part of the organization for 47 years, 28 of them following the 1992 Maastricht treaty which transformed the European Communities into the European Union with the contours of a shared political framework (see Cini, 2007) for an overview of the European Community, the Maastricht treaty, and the European Union as a political entity). Therefore, we cannot ignore the history of England—EC/EU relations, but should also note that the relationship has not always been cordial, and did come to an abrupt end. As is discussed below, the European integration processes has been seen differently in England and France.

Officially, education is the prerogative of the nation state, without EU influence on the matter. However, in spite of this, the EU has been identified as a driving force behind Bologna (Simões et al., 2018). The EU has also made large inroads into coordinating and funding educational research through the Horizon (2020) program leading to some convergence in educational research (Powell, 2020), particularly as EU funds are often seen as “elite” and the pinnacle of research funding in education (Zapp et al., 2018a,b). Although the EU’s reach into teacher education is legally limited they still are very much present particularly on the agenda-setting stage of policymaking. Their power as such, seems to mostly lay in research funding and dissemination of ideas and values through publications and workshops such as the European semester whose original and official purpose is economic coordination, however, their Europe 2020 agenda identified education as one of five key areas for the semester to focus on (Wilkinson, 2019). Central to such “EU level” discourse on teacher education is arguably the perceived vital role teachers play in advancing human potential, shaping future generations and influencing society as a whole (Simões et al., 2018). A result of such emphasis has been argued to manifest as a form of “European teacher” (Simões et al., 2018). Thus, discussion of education, including teacher education and the related topics of educational research and higher education are all under the EU umbrella of coordination, standard setting, and idea dissemination.

However, it is important not to fall into a common pitfalls of neglecting cultural differences as to what “global” may mean, and how academic concepts such as “globalization,” “global/regional standardization,” “convergence” or “unification” may be at least as much constructions of the social sciences as empirical observations of “real” phenomenon (Tröhler, 2014). Instead, globalization, regionalization, and other catchwords denoting a global interdependence or a global organizational field and institutionalized environment, must be carefully analyzed and seen in relation to unique contexts that are both temporally and spatially dependent. Thus, we may talk of a global scale or level of organizational fields and institutionalized environments (both plural) pertaining to education, but as we do so we must relate it back to other levels of the scale and avoid temptations to overly

generalize without denoting local variances of importance. This is evident for instance in how similar scripts and modes of thought may influence the construction of new practices, but at the same time be tempered by local factors and political bricolage resulting in translation and shifts in meaning (Maroy et al., 2016). For these reasons, a global cognitive blueprint, such as the knowledge economy, has been found to not be uniformly adopted in specific contexts but takes on local variances (Zapp et al., 2018a,b) that arguably constitutes a separate derivate blueprint, which may again resonate differently in other contexts and again find itself translated and changed into a new and different blueprint (e.g. the knowledge economy becoming the knowledge society). In other words, there is nothing static about idea transfer and the spread of “what works.” This then leads us to the importance of not only emphasizing the global or the regional, but to always keep an eye on the local context as well to which the essay now turns.

The local context: England and France on diverging trajectories

England is characterized largely as a systemless system in education, held together by data-flows centered on certification, inspections, and prescribed standards (Lawn, 2013; Helgetun and Dumay, 2021). Within this systemless system the state has comparatively low internal capacities to directly govern teacher education and produce data for policy, instead relaying on governing at a distance mechanisms (Ball, 2016; Ozga, 2009, 2019) and external sources such as the NFER or Education Datalab to produce evidence for policymaking (Helgetun and Menter, 2020; Helgetun, 2021). As such, England has a textbook new public management system of governance in (teacher) education at present. Meanwhile, in ideological terms education, including teacher education, is increasingly framed by both the concept of the knowledge economy as well as neo-liberalism centered on a free market of provision under state prescribed rules of the game. The neo-liberal system of today, that is coupled with new public management methods of steering at a distance through inspections and data flows, arguably grew out of a largely free model of teacher education devoid of much accountability or harmonization prior to the creation of the Qualified Teacher Status certificate in 1984 (Furlong, 2013). In terms of provision, this has led to a fragmented system where teachers are educated in a myriad of ways centered either on Universities, School-Centered Initial Teacher Training providers, or true partnerships between the two (Whiting et al., 2018; Helgetun and Dumay, 2021). In other words, there is no central model for teacher education (there never has been), only the teacher standards that form the basis of the QTS to standardize and define what a teacher is in England and therefore what their education should be (Childs and Menter, 2013; Helgetun and Dumay, 2021; Helgetun, 2022). The development of the QTS was in one sense the outcome of local concerns, such as the Great Debate in Education started in 1976 by Labor Prime Minister Jim Callaghan and concerns regarding was seen as a secret garden of the curriculum and progressive excesses in education (Phillips, 2001), which can be traced back to the “Black Papers” in the 1960s (Helgetun, 2021). Meanwhile, the OECD were emphasizing the link between the economy and education and the need for state intervention in a time of economic upheaval following the 1973 oil crisis, further influencing the perceived need for the state to take on an active role in all aspects of education (Phillips, 2001), including teacher education (Furlong, 2013). Hence, there were both local and international debates shaping the need to devise some system of state intervention in the fragmented landscape of education in England, leading to the current iteration of the systemless system in teacher education (Helgetun, 2022). These changes have led to normative transformations in England, where the teacher now is arguably a form of “self-improving craftsperson” (Helgetun and Dumay, 2021), rather than the old image of a “scholar who just happened to be a teacher” that was almost taken for granted (at least by academia) prior to the Great Debate (Furlong, 2013). As such, the teacher is today defined as a professional anchored in the school more than in academia, while government policy is moving in a traditional direction.

By contrast, education in France, including teacher education, is shaped by a Jacobin logic (Normand, 2013) and meritocratic myth centered on the values of the French republic. The Jacobin approach centers on a strong educative state which aims to educate the future leaders of the country through a meritocratic approach that enables these shepherds to guide and lead the flock (Helgetun, 2021). This necessitates centralized control over an education system that is harmonious and as singular as possible (Alexander, 2001), while being rooted in the local context of *la République Française*, where technocratic mastery is displayed by the state. This view on the teacher harkens back, at least, to the French Revolution of 1789 (see e.g. Condorcet (1792)), and became cemented through the Ferry laws in 1881/2 (Prost, 2013; Helgetun, 2021). As such, teachers were, and still are, in France seen as “agents of the republic” who are educated by the French state as uniformly and harmoniously as possible to represent the values of the republic (Ozouf and Ozouf, 1992; Farges, 2017). Meanwhile, the French state takes responsibility for the large-scale production of both qualitative and quantitative data to shore up policy in education through agencies such as the national education inspectorate (IGEN) and national data analyst center in education (DEPP) (Helgetun, 2021). As such, the French model is much more static than its English counterpart at an ideological level, in spite of dramatic changes to the mode of provision instigated by the creation of the IUFM in 1989 (Prost, 2014). The changes are instead centered on improving the forming of these agents of the republic through an increased emphasis on the university (Saciolotto-Vasylenko and Fave-Bonnet, 2011; Cornu, 2015). This contrasts to England where the change was not only in terms of form of teacher education, but also in the very meaning of what a teacher was to be. To provide some context, the IUFM when created by law in 1989, was the first unified institute of teacher education in France encompassing both primary and secondary teachers. Prior to the opening of the IUFMs in 1992, primary teachers were educated in “teachers’ colleges,” while secondary teachers had no formal teacher education beyond requirements of a graduate degree in the subject they were to teach and the passing of the civil service entry examination known as “concours.” The concours is adapted to the type of civil servant one desires to be, and was as such aimed at becoming a teacher.

However, it was, and is, heavily focused on subject knowledge and not knowledge of how to teach. See for example [Helgetun \(2021, 2022\)](#) for an elaboration on the history of teacher education in France in English, or [Prost \(2014\)](#) for a more comprehensive history in French.

To further analyze the European dimension behind these shifts, as observed by John [Sayer \(2006\)](#) English policymaking has not taken European trends into account at any point in regards to teacher education. Meanwhile, according to [Helgetun and Menter \(2020\)](#) for example, references in teacher education policy documents in England are to Hong Kong and Singapore more so than European countries (with the exception of Finland) or even Wales, Northern Ireland, or Scotland. Furthermore, as noted by [Chung \(2016\)](#) the inspiration for teacher education policy following 2010 was the Finnish education model, which was much misunderstood and abused. Moreover, there are no references of note to Bologna in the national discourse, nor does teacher education follow the 3 + 2 + 3 model. Meanwhile, courses are not denoted in terms of ECTS but a national credit system. It appears then as if England is content not to adopt European models, but instead cherry picks policy ideas from across the globe. By contrast, France has engaged with Bologna, but not to actually mirror trends elsewhere as so much as implementing desired national reforms. Teacher education became systemically linked to the university in 1989 with the above-mentioned creation of the IUFM that instigated a 3 + 2 system where future teachers would first attend 3 years of undergraduate studies in a subject area, followed by a two year post-graduate education in teaching well before Bologna ([Bon, 2014](#)). However, a reinforcement of the master component of teacher education was begun in the mid-2000s, culminating in the change from the IUFM to the ESPE in 2012 and creation of a “new” Master in Education and Teaching the same year, all supported by arguments centered on the need to respect Bologna and fully incorporate the 3 + 2 + 3 system in teacher education as this was what “others” in Europe were doing ([Helgetun, 2021, 2022](#)). However, there remains limited evidence that others were in fact doing as the French were, and a closer examination of the discourse seem to indicate that Bologna was a useful argumentative tool for implementing reforms begun in 1989 ([Bon, 2014](#)).

Here, derivative theories from [Putnam’s \(1988\)](#) two-level games (e.g. liberal intergovernmentalism, see [Moravcsik, 1993, 1997](#)) may help explain these relations better than dominant models in international and comparative education rooted in supranationality or international policy-borrowing ([Steiner-Khamsi, 2010](#)), which focuses predominantly on sense-making and legitimization that makes *different modes* of engagement with Europe harder to explain. To my understanding, [Moravcsik’s \(1993\)](#) theory of liberal intergovernmentalism would see England’s ignorance of Bologna as a national play with implications on two-levels, both in terms of signaling internally that the DfE, not Brussels is in charge of education, and internationally that states do not need to harmonize in education (a wish for limited European integration). In France, by contrast, the imaginations of Europe are of a different nature, the image of Europe for French intellectuals is of France as Europe and Europe as France ([Chabert, 2011](#)). The two-level play would then harmonize around sending strong signals to Europe of the need to adopt Bologna and the 3 + 2 model, also in important national aspects such as education. The international concerns do here further nudge the national considerations, not because of what other states do nor only internal (national) concerns, but so France in the future can help push for further European integration in education.

Concluding remarks

To recapitulate and conclude, neither England nor France from their inception existed in isolation from the other, nor from the wider world, even though some accounts may create a semblance of national development existing in isolation prior to the “modern” and “post-modern” eras of globalization. Cross-national diffusion of ideas and engagements with similar cognitive blueprints is nothing new. However, what has changed are the speed of communication and the reach of dissemination. Ideas on education and the teacher is now reachable in every home with an internet connection through sites such as Wikipedia or Google where one can find for example PISA reports and rankings, Eurydice reports on the (believed) layout of an education system, or the book *Émile*.

Meanwhile, as argued in this essay, contrasts must be understood as an interplay between different levels of an environment (local, regional, global). Therefore, one may say the two cases are distinct in so far as one is turning toward the practical and the other is focused on integrating teacher education within the university, but not that they exist in isolation from one and other. This becomes apparent as we see how they engage with ideas of the enlightenment, of democracy and expertise, but in different ways and with distinct emphasizes that form different trajectories of abstract state governing logics and explicit teacher education policies. As such, the key to comprehending teacher education policy, is understanding the local socio-cultural and historic specificities which translates and transforms international trends into local outcomes (see also [Brisard, 2002](#); [Crossley and Watson, 2003](#); [Crossley, 2010](#); [Maroy et al., 2016](#)), arguably leading to what [Maroy et al. \(2016\)](#) label vernacular globalization. One way to analyze the intersection between global, regional, and local trends is through contrasting comparison with an emphasis on the historical developments and particularities of both state governing and education logics and beliefs. In other words, to analyze both ideas of (teacher) education and ideas of good governance and the purpose of the state in a given context, while keeping an eye on the wider contexts (e.g. Europe, the globe) the object of analysis is located in. This approach however, would benefit from a coupling with two-level game type theories ([Putnam, 1988](#)) such as liberal intergovernmentalism ([Moravcsik, 1993](#)), to fully analyze the complex interaction between international and national concerns that policymakers and practitioners in education constantly engage with. This provides further analytical models to comprehending why we see vernacular globalization.

Based on what has been presented in this essay, we can say that the national imaginary vis-a-vis Europe plays an important role in shaping how England and France engage with Europe differently due to both national *and* international considerations that are rooted in the distinct national socio-historic trajectories rooted on the one hand in the French revolution of 1789 which led to a strong educative state, and on the other in a liberal system of education without an overarching educative state. These national myths, as socially constructed imaginaries, can then also be said to fully constitute what Benedict Anderson (2006) called imagined communities where we imagine ourselves to share a life with our compatriots, for France parts of this community extend into “enlightened Europe” (France is Europe), while in England it ends with the Channel Islands, and for some also at Hadrian’s wall and the March of Wales. Interestingly however, England does references the far reaches of the former British Empire such as Singapore and Hong-Kong, but not Scotland or Ireland. At the same time, Bologna becomes an important cognitive blueprint (Zapp et al., 2018a,b) that is accessible for national policymakers in England and France as they try to both figure out how to do teacher education and how to justify it within an “evidence era” paradigm (Helgetun and Menter, 2020) where such blueprints are worth more than their weight in gold. Through understanding such divergent trends under common umbrellas, we begin to flesh out the context sensitivity of not only teacher education policy, but also of the teaching profession and the career of teachers that is intricately tied to the teachers’ education.

Introduction

In 2021, a Special Issue of *Teaching Education* took its theme from Lawrence Stenhouse's statement that research should look less to the world and more to the village (1981): as a call for more teacher engagement in the world of education research. In my contribution to that special issue (Brooks, 2021b), I argued that the profession's capacity to contribute to research was being diminished due to the reduced capacity of research in initial teacher education: in short that research was being squeezed out of teacher education. My argument was based on four trends that I observed while conducting an international comparison of teacher education programs in five universities (located in Australia, Canada, England, New Zealand and the US). I outlined these four trends as follows:

The first [trend] is that the role of universities within teacher education is precarious, along with the perceived value of research in teacher education. The second argues that prospective teachers do not perceive teaching as a research-based profession and therefore expect teacher education to be practice-orientated. Teacher education accountability structures downplay the significance of research as part of a teacher's knowledge base and practical repertoire. And finally, the career trajectories and contractual arrangements of teacher educators reduces the overall research capacity of the field.

Brooks (2021b).

The combination of these four trends presented a diminishing capacity for (new) teachers to be inducted into their potential engagement with educational research, which may limit their ability to engage meaningfully in research later in their careers.

Tatto (2021) has also argued for a greater focus on research in teacher education as an important counter-balance to some of the value-added methods that are increasingly driving education policy and practice. In her paper, she outlines a growing division between the practice of teaching and educating teachers and the research that influences education and in doing so, asks important questions about the role of research within teacher education:

Who should produce the knowledge that must be used to guide policy and practice in the teaching profession? What conditions enable and constrain teachers from engaging in such research? How does generative and transformative teacher research sit alongside structures and cultures of professional compliance?

Tatto (2021).

In my paper, written during a period of COVID-19 related lockdown, I concluded on an optimistic note, recognizing a range of changes that were occurring across the education sector and the potential they provided for these trends to be reversed. Prompted by the need for immediate and swift action in the light of the pandemic, many governments were turning to "experts" for advice about how to make adaptation in many areas of life, as such research seemed to be having a renaissance. Teacher education was no different. Recognizing the need to continue to educate teachers to ensure teacher supply, and the very real challenges that lockdowns and school closures presented for doing so, in many places teacher educators were consulted and given new levels of autonomy to make adaptations to their programs and practices. Such changes, I argued, could be seen as the start of a shift toward enabling

teacher educators to redefine their practices in a less controlled environment and as such the role of research within teacher education could be foregrounded, which could enhance the research capacity of new teachers.

In this chapter I build on the arguments I have outlined above, and reflect on whether my optimism was warranted. My experience, based in England, has been dominated by the Department for Education's ITT (Initial Teacher Training) Market Review report published in July 2021 ([Department for Education, 2021](#)), and the public consultation which followed. My experience suggests that my optimism was indeed unfounded, and that the future of teacher education in England with respect to research capacity is likely to be diminished further. Alternatively, I have been interested in the developments in Wales, where the publication of the National Strategy for Education Research and Enquiry (2021) presents a very different vision for the role of research, and indeed for building the research capacity for research in teaching and in teacher education. Using the four trends highlighted in the 2021 paper as an analytical framework, I explore these two different approaches and their likely impact on new teachers' research capacity. In doing so, I argue that policy is a significant force in defining the importance of research in early teacher development and whether research is seen to make a valuable contribution to education development as a whole.

The value of research within teacher education

While there are few detractors about the value of research in teacher education, and indeed much to suggest that is a strong feature of teacher education in so-called high performing systems, ([Darling-Hammond, 2006](#); [Darling-Hammond and Lieberman, 2013](#); [Darling-Hammond et al., 2000](#)), there is some debate about the ways in which research contributes effectively, whether it is seen as "content": making up the knowledge base for teacher education through research-informed or evidence-based findings about ways to teach; or as a form of teacher education pedagogy: using research as a way of learning about teaching both in the initial stages but providing a pedagogy of professional development and improvement throughout a teacher's career.

In practical terms, how research is positioned on teacher education programs varies, as outlined by [Menter et al. \(2010\)](#) who categorized four forms of teacher professionalism showing how research can be positioned differently within them: for example:

- The effective teacher: with an emphasis on meeting standards and competences, positions research as content to be digested and understood;
- The reflective teacher: with an emphasis on individual professional development achieved through practice positions research as being a tool with which to challenge assumptions based on experience;
- The enquiring teacher: adopts an enquiry approach, which in some cases has veered toward a research orientation
- The transformative teacher: which adopts an activist stance in relation to enquiries in order to contribute to social change and sees research as emancipatory.

Research can therefore be seen as a way of challenging assumptions about teaching, as a way of investigating and inquiring into (personal) practice, but also as a way of challenging issues of equity and justice that exist within education, and providing a range of ideas possible for transformation. The BERA-RSA inquiry into research-informed clinical practice also discusses the range of different approaches to embedding research across ITE, and the impact research can have on teacher's professional learning ([Burn and Mutton, 2013](#)). How new teachers experience research can vary enormously.

Four trends affecting research capacity

In 2018–2020, I conducted a study of five large scale ITE providers in order to research the features of high-quality large-scale initial teacher education. Even though the universities I studied were situated in different contexts (Queensland University of Technology (QUT) in Australia; Ontario Institute for the Study of Education (OISE), University of Toronto, in Canada; University of Auckland, in New Zealand; UCL Institute of Education (IOE) in London, UK and Mary Lou Fulton Teachers College, Arizona State University (MLFTEC), USA), the role and function of research within their programs was a dominant theme. All the universities valued and prioritized research and saw it as an important aspect of their practice: but within that framing they all encountered very similar challenges and concerns:

- What was the best combination of research and practice within program design?
- What sort of research should new teachers be inducted too, how much research methodology did they need to understand, and to what extent was research literacy a key aspect of the assessment of their programs?
- What were the research expectations of teacher educators? How were they supported to be research active? What were the university expectations around research, and how does adopting a research perspective sit with the expectations of being a teacher educator?

A further common theme was the role of research in the accountability structures that were pertinent to teacher education, and the extent to which research was valued as part of a teachers' initial professional development. The answers to these questions reflected the different program structures and designs and the extent to which being research-aware, research literate, and even research-active was an expectation of new teachers in those contexts. Upon reflection, these contextual perspectives are perhaps one of the most influential dimensions that affect research capacity of new teachers. Throughout the research I observed teacher educators adapting

their practice in line with local knowledge and expectations, and the capacity they themselves were given to enact change (as reflected in my model of ITE practice outlined in [Brooks, 2021a](#)). However, the reason why teacher educators were needing to adapt their practice was often because of the policy context, and the climate that this created for the possibility for research. The policy context then can be seen as a key component that can enable or constrain research practices in initial teacher education.

Two recent developments have provided a good opportunity to explore this phenomenon in more detail and to exemplify how the policy context creates the conditions for research capacity. In England, under the banner of an ITT Market Review, the government's Department for Education appointed Expert Group published a series of recommendations. The subsequent public consultation prompted a range of widespread criticisms of this report by a range of stakeholders: a key theme of which was the role of evidence and research as presented in the report. Alternatively, in Wales, the National Strategy for Education Research and Enquiry foregrounds research, and promotes partnerships between universities and schools in the education of new teachers. Published in July 2021, the challenge for teacher educators in Wales is the roll out of this strategy, and to consider the implications for schools, teacher educators and new teachers to transform teaching into a research-based profession at all levels. The analysis for this paper is based on a review of relevant literature for both, which included the policy documentation, published blogs and reports and consultation documents in response, and also interviews with university-based teacher educators with responsibility for rolling out these policy initiatives. I have sought to summarize the emerging trends as I see them, but as the documents are at different stages of agreement and implementation, the trends themselves are early in formation and the impact has yet to be realized. The intention here is to see them as indicative of different policy approaches which can highlight how research capacity can be diminished or enabled and to consider what the implications of that may be. After a brief introduction to the four trends outlined in the previous paper, I will explore each of the approaches in turn and how they appear to enable or constrain research capacity.

The diminishing role of universities in initial teacher education

In my previous paper, I argued that while in many countries around the world, universities are still the main provider of initial teacher education, the role of universities has diminishing in prominence. Citing evidence on the rise of non-university-based routes into teaching (in particular the growth of the Teach First/Teach for All movement), and the increasing interest in non-university-based routes, some of which were school- or employment based, I noted that in some cases this means that routes into teaching might have little or no research content. Indeed, the growth of non-university-based research organizations represents a changing dynamic between universities and their (taken-for-granted) role in initial teacher education, and in particular could affect the role of research in the pedagogy and content of teacher education programs.

For proponents of a school-based teacher education system, the diminishing role of universities is not perceived as a problem. The role of universities has always been problematic, both from the view of universities themselves, where teacher education was considered a weak discipline with a poor track-record of research ([Labaree, 2006](#)), but also from the idea that a university-based teacher education was not sufficiently grounded in practice, and was too theoretical, abstract and irrelevant. While this is a fairly caricatured image of university-based teacher education that does not reflect the variety of knowledge traditions it encompasses ([Furlong, 2013](#); [Furlong and Whitty, 2017](#)), it is a pervasive account often used to discredit university-based providers (for a detailed account of this in the US, see [Zeichner, 2017](#)).

Research funding in England for teacher education has always been limited. This has been exacerbated by the changing dynamic of education research funding in England toward the Education Endowment Foundation (EEF), which funds a narrow range of research described as overly instrumentalized, dehumanizing and reliant on a narrow range of research methodologies such as Randomized Control Trials ([Ellis et al., 2018](#); [Godfrey, 2017](#); [Hulme et al., 2020](#); [Turvey, 2018](#); [Turvey and Pachler, 2020](#)). At the same time, there has been a growth of teacher-research orientated movements such as ResearchEd which focus on practitioner-to-practitioner research accounts, and which has received support from key politicians, while many of its proponents are highly critical of research conducted by higher education institutions ([Watson and Barnes, 2021](#)). [Tatto \(2021\)](#) also notes the influence of value-added methods and econometric based analysis on education policy, and how these tend to come from different sources than university-based teacher educators.

Universities, however, are still central to knowledge generation and its validation and verification ([Furlong and Whitty, 2017](#)) which make up the specialist knowledge necessary for the recognition of a profession, but their role in education research is diminishing. However, [Young and Muller \(2014\)](#) have argued that such a perspective is necessary to counter the anti-intellectualism of professional development, often found in fields which emphasize expertise over knowledge. Despite this academic recognition, the reality of teacher education in many international settings is an increasing erosion of the perceived importance of the university in defining the knowledge base for teacher education, or indeed as the main context for qualification to become a teacher.

Pre-service teachers and their expectations of teaching as a research-based profession

A key factor in the success and impact of research in teacher education lies in how it is perceived by new teachers. New teachers enter the profession with an image of what being a teacher will feel like and an expectation of what sort of preparation they will need to become a teacher. These expectations will vary by individual but are influenced by public images of teachers ([Moore, 2004](#); [Henry, 2020](#)) and also their own experience of having been taught ([Lortie, 1975](#)). Despite an emphasis on research and enquiry in many of the programs I researched ([Brooks, 2021a,b](#)), there was still evidence that new teachers did not perceive teaching to be a research-based profession or that undertaking research was a valuable or essential component of their programs. I argued that this was linked

to a strong public discourse about teaching as a practical activity requiring technical skills or behaviors rather than a propensity to undertake or be engaged with research. This discourse is so strong that new teachers, keen to be the best they can be, do not expect to see research as part of either their initial training or as a part of their role as a qualified teacher.

Teacher education accountability structures and the significance of research

Accountability structures shape activities, even when situated as minimal requirements. When those accountability structures downplay the role of research, and situate the (new) teacher as a passive consumer of research: this can be seen as part of the "what works" discourse that has been critiqued by [Biesta \(2007\)](#) as profoundly uneducational, in particular because it lacks the nuance required for situational judgements. This was in contrast to the teacher educators I spoke to in my research who were passionate about the role of research on their programs not just as content but as a form of professionalization, best described by the Cochran-Smith and Lytle phrase "inquiry as stance" ([Cochran-Smith and Lytle, 1999](#)).

Acknowledging the pervasiveness of how and why research is considered important in teacher education across different contexts, how research is then presented and discussed in key accountability documents can send a different message. Verb constructions in key documents that influence teacher education in England situate the relationship between the teacher and the research as a passive one; where the teacher "draws on", is "informed by" and can "demonstrate" their knowledge of research (2021). The idea of a teacher as researcher or as a critical consumer of research are absent.

Career trajectories and contractual arrangements of teacher educators

University-based teacher educators tend to come from two backgrounds: either having had previous experience as an academic researcher, or as enrolled on a doctoral program ([Cochran-Smith et al., 2019](#)), or as a former teacher who has to undergo an identity shift in order to transition into their new role ([Trent, 2013](#); [Williams, 2014](#)). For some, teacher education was not their intended career goal, and it is commonly referred to as *second-order* ([Murray and Male, 2005](#)), which reflects to an extent the lack of systematic professional development they receive ([Holme et al., 2016](#)).

In contrast to teacher educators who are based in school contexts, university-based teacher educators are part of the university faculty, and so also need to address the expectations of being an academic and the precarious nature of academic contracts. These concerns are typified by what Grudnoff ([Cochran-Smith et al., 2019](#)) has called the bifurcation of their roles: as they juggle being both academics and teacher educators. [Ellis and McNicholl \(2015\)](#) have noted the heavy workload involved in university-based teacher education (particularly when they include time-consuming school visits), and the tensions that the teacher educators face in handling research expectations as a faculty member. [Cochran-Smith et al. \(2019\)](#) highlights the challenges this presents for the teacher educators, including:

- Their ability to be recognized within their institution as researchers and academics;
- The induction and professional development they need in order to become high-quality teacher educators;
- The dissonance between the dual expectations of them as teachers of teachers and as academics and researchers.

This is further complicated by the lack of status and respect offered to education faculty and the work they undertake in the academy ([Labaree, 2006](#)). This has been compounded by changing working conditions ([Ellis and McNicholl, 2015](#); [Furlong, 2013](#)), increasingly orientated around temporary and casualized employment contracts, reducing the opportunity for professional development and career advancement.

These four trends make up a context of diminishing research capacity within teacher education, and by extension then for new teachers. This context, however, is largely driven by education policies which outline the possibilities for research to occur in each of these four areas: in the eyes of new teachers, in the careers of teacher educators, the accountability structures, and in the role given to universities in the teacher education landscape. The next two sections discuss how two contrasting policy contexts create the conditions that can enable or constrain research within teacher education.

The ITT Market Review in England

The ITT Market Review was undertaken by an Expert Group convened by the Department of Education (DfE) of the British Government during 2020/21. The ITT Market Review applies only to teacher education (or teacher training (ITT) to use the DfE's vernacular) in England, as this responsibility is devolved to respective governments in Scotland, Wales and Northern Ireland. The review is a response to the highly differentiated landscape of teacher education (taught through a combination of university led and school-based routes) that has emerged from previous policy initiatives, leading to a teacher education "market" that is described as being both diverse and complex ([Whiting et al., 2018](#)).

During the period between the establishment of the Market Review and the publication of its findings, there were a number of other related activities: Ofsted, the government's inspectorate, published a new ITT Inspection Framework, and a controversial and critical report into how ITT providers have responded to the pandemic. Teaching School Hubs, a major initiative in the teacher training infrastructure were announced, as was the national roll out of a suite of government-owned professional development programs (the Early Career Framework (ECF), and National Professional Qualifications (NPQs)), and the continuation of the

High Potential Initial Teacher Training contract awarded to Teach First now in its 19th year. The tender process for a new government-initiated flagship teacher training institution, the Institute of Teaching, had also begun. In other words, the landscape of ITT was changing and changing rapidly. With new players being introduced to the "market" and the fundamentals of that market changing substantially.

The Market Review group published their report in June 2021, which consisted of 14 recommendations, and a list of Quality Requirements which would constitute an accreditation process for all providers. In this document, the main aim of the review is described:

The central aim of the review and our recommendations is to enable the provision of consistently high-quality training, in line with the CCF, in a more efficient and effective market.

The CCF referred to above is the government's ITT Core Content Framework published in November 2019, which "defines in detail" the content of initial teacher training programs as a "minimum entitlement" which the DfE describes as drawing upon "best available evidence" although this claim is disputed. The Market Review focusses heavily on evidence (evidence is mentioned 88 times in the document, research: 40 times), which is taken from a range of government documents related to teacher education: the ITT Core Content Framework (CCF), the Early Career Framework and the National Professional Qualifications, each of which has been verified by the Education Endowment Foundation (the CEO of which was on the Expert Group that authored the ECF). Where research is mentioned in the document it is positioned as a mechanism for which "evidence" is procured and produced. For example, in the first paragraph of the document it is stated:

We must ensure that teachers receive high-quality training and professional development at every stage of their career, and fundamental to this is initial teacher training (ITT). This means ensuring that all teacher professional development, from initial training through to advanced leadership development, systematically and consistently draws on the knowledge we now have about teaching from up-to-date and high-quality research.

The emphasis in the recommendations on evidence rather than research positions the teacher passively in terms of their (direct) engagement with research. This has been a recurring theme in the English education system, promoted initially in the Carter Review of Initial Teacher Education (2015) and critiqued in the Burn and Mutton report for the BERA/RSA inquiry into research and teacher education (Burn and Mutton, 2013, 2015). The Carter Review argued that there are limitations on trainees' abilities to engage fully in research, and positioned them as "intelligent consumers of research who take an evidence-based approach to their own practice" (Carter, 2015, p. 21). The review recommends the creation of "synthesized executive summaries providing practical advice on research findings about effective teaching in different subjects and phases" (Carter, 2015, p. 8), which places the teacher as a passive consumer of research who is also unable to make selections about the sorts of research they wish to engage, and places teacher educators as the curators of such executive summaries. This perspective privileges a particular type of "what works" research which has been widely criticized for its lack of contextual detail, ethical reflections and transferability (Biesta, 2007).

However, the current policy landscape takes this one step further. The publication of the document "Delivering World Class Teacher Development" in June 2021 by the DfE includes an Annex on Delivery infrastructure which shows diagrammatically the relationship between the DfE, providers and other organizations. Placing the DfE at the head of the diagram the document, the diagram is annotated as:

The DfE created evidence informed frameworks, validated by the Education Endowment Foundation (EEF).

In other words, this infrastructure not only places the teacher as a consumer of previously curated research, but also places the DfE as the curator of that research or evidence. This is a distinct move away from the Carter Review which, while promoting the teacher as a consumer model, clearly situated the teacher educator as the curator of what was deemed appropriate evidence.

In addition, there is a distinct absence of universities in the Market Review Report (only two specific mentions in the whole document and in neither case as a provider of teacher education). However, what is perhaps of more significance is that the evidence cited in the Market Review document itself shows a preference for research generated outside of universities. The Market Review document contains citations of:

- 4 articles from peer-reviewed journals
- 4 reports from non-university organizations, and
- 18 government publications.

The dominance of research from non-university sources is indicative of a further diminishing of the perceived role of universities in their contribution to teacher education, but also in their role in generating research for that community. The preferred emphasis is on government-sponsored publications.

Curating research and presenting it as content is of limited benefit for new teachers, as it renders them unable to consider practical implications of implementing research findings or the ability to judge the merits of research on its methodological rigor or contextual or situational appropriateness. However, the ITT Market Review recommendations goes further by not just outlining the content of teacher education programs but also the ways in which that content should be presented to new teachers:

- the assessment regime of trainees has to be orientated on the content of the CCF (and only on their ability to demonstrate the Teacher Standards at the end of the program),
- the programs have to be planned in relation to a pre-defined set of sequenced intensive experiences (as opposed to be in line with student teacher needs or requirements),
- and the training of mentors and their monitoring aligned with pre-determined conditions and parameters.

In other words, the proposals outline the need for a specific, pre-determined and pre-set “sequenced curriculum” as a precondition for re-accreditation. The room for accommodation, deviation and individualization is limited, as is involvement of school partners, or student teachers in the construction of that curriculum (compounded by the very short timescales indicated). Under such a regime, it is likely that new teachers will remain passive as others curate research for them to consume and apply.

This is further compounded by the proposed accountability structures. Under the Recommendations all providers need to be reaccredited for which they would need to demonstrate that they have met a series of Quality Requirements. Not only do these requirements foreground the government's own alternative to universities, the proposed Institute of Teaching, but it also outlines that the accreditation process would involve assessment of the following:

- the development of a selection of detailed curriculum planning, including at subject or phase-specific level,
- the development of at least part of the mentor training curriculum,
- demonstration that the provider has in place the fundamentals of a workable delivery chain, including key ITT lead partners or other key parts of the delivery structure,
- a sample of the curriculum-aligned assessment framework to be used, and
- sufficient detail on quality assurance arrangements to provide assurance that the approach will meet the demands of the Quality Requirements.

The Quality Requirements detail components of the anticipated planned curriculum for new trainees for example:

Providers must identify how all components of the planned curriculum will be taught, applied to practice in a range of contexts and assimilated. The curriculum should encompass a variety of approaches, including direct explanation, deconstruction, structured and focused observation and targeted practice with systematic analysis, feedback and mentoring. At all times, the planned and sequenced curriculum must closely inform taught components, independent learning, practice and feedback.

Further detail is provided on how this is to be achieved, and where new teachers are expected to be engaged with research, that research again has been curated for them by official government organizations, such as the inspectorate Ofsted:

Subject-specific approaches must be delivered by suitably qualified experts and take full account of the evidence available for subject-specific teaching, for example Ofsted subject research reviews.

Research that has been previously curated by official government bodies has then become the content for teaching programs. The notion of inquiry, or research informed clinical practice as stance is not just absent but has been completely side-lined. The outcome of such an approach will be for new teachers to perceive themselves as passive consumers of research that has been curated for them, and presented to them for consumption and implementation. Their capacity for research will be diminished even further.

Finally, the English ITT Market Review Recommendations are silent on the issue of teacher educators, but does make extensive reference to “providers”, and “mentors”, including the provision for a monitoring role given the title of “lead mentor”, and for those that undertake these roles to follow only government-approved development programs. The review also refers to “experts”, and “subject experts” but the attribution of this role to either school-based or university-based teacher educators is not defined. There is stipulation of the time that should be allocated to certain tasks and the role of schools to ensure that such requirements are met. The impact on teacher educators themselves is not considered.

The Welsh National Strategy for Education Research and Enquiry

Developed in response to disappointing educational performance in Wales, the opportunities afforded by devolution, and a desire to empower the teaching profession, the Welsh government announced a new vision for teacher professionalism, one that is encapsulated in the National Strategy document, published in June 2021. The Welsh National Strategy document consists of

Aims, Objectives, Priorities and Domains, and outlines the necessary national infrastructure, including the roles for higher education, researchers, collaborations, Research Centers and expectations of the profession itself, and the provision of Schools as Learning Organizations. The Aims and Objectives are outlined as:

Aim

The aim of the NSERE is that educational policy and practice in Wales should be informed by the best available research evidence and disciplined enquiry undertaken by educational professionals.

Objectives

The objectives of the NSERE are to:

- further support the development of evidence-informed policy through engagement with a wide range of research by Welsh Government and other parts of the educational system in Wales
- further develop high-quality research capacity and volume (that uses a range of methodological approaches) within our HEIs that can help serve the needs of the Welsh education system
- develop an evidence-informed profession in Wales where leaders, teachers, support staff, LA and regional consortia staff and other educational professionals use high-quality research evidence and are provided with opportunities to take part in robust professional enquiry
- contribute to and learn from international research and evidence.

The National Strategy also set priorities that were aligned with other Welsh government education initiatives and recognized that different “interdependent domains” that would need to support this infrastructure. The Welsh National Strategy, as [Furlong \(2019\)](#) outlines, has to be seen as part of an integrated education strategy in Wales designed to improve the quality of education provision that also includes teacher-led school and curriculum reform. Similar to the ITT Market Review document, the National Strategy places a lot of emphasis on evidence, although as the analysis below will outline the emphasis and orientation is quite different.

The distinction between the different roles and functions of research in initial teacher education is made explicit in the Welsh National Strategy, which distinguishes between research and enquiry, and makes a clear commitment to both:

We recognise that “research” can encompass a spectrum of activities that utilise research methods. We do not subscribe to a view that research is something that can only be done by professional educational researchers and not by educational professionals. We are interested in the concept of a “continuum” of development whereby educational professionals move from being professional enquirers to becoming teacher researchers. We wish to learn from developments in this area in other professions, especially the health profession.

The National Strategy also supports the idea of teachers as both consumers and producers of research:

The developments we propose to undertake will focus on enabling practitioners to be both consumers of high-quality research and producers of professional enquiry that is informed by rigorous research methods. This is the reason why we choose to have both “research” and “enquiry” included in our strategy, so that the approach we take in Wales is inclusive and “close to practice.”

The National Strategy also acknowledges the difference between research and enquiry while emphasizing that they are “of equal value and interdependent”:

- “Academic research” is a process of investigation leading to new knowledge. It is published so that others can learn from and critique it. To be regarded of high quality it should be significant, original and rigorous. To that end, it should be peer-reviewed before it is published. This type of research is usually undertaken by academics, those studying for higher degrees and professional researchers working in the government and independent sectors.
- “Professional enquiry” is usually undertaken by practitioners within their workplace as a way of identifying problems, establishing causes, finding solutions, evaluating practice and achieving improvement. If it is to be of value it should utilize action research approaches that are systematic, cyclical and that emphasize the collection of evidence.

The National Strategy restates a commitment to universities being involved in teacher education and the importance of enhancing the research capacity of the universities to enable them to do that. The National Strategy outlines that it will do that through:

- Build[ing] upon existing strengths within the sector, including existing collaborative research structures

- Ensure[ing] that the intent expressed in the accreditation criteria for new initial teacher education (ITE) programmes in Wales (that all staff should become research active) is fully supported, allowing more of them to be included in future Research Excellence Framework (REF) exercises than has previously been the case (pages 14/15).

There is recognition that the capacity for education research in Welsh universities needs support, and also that there is a need for collaborative and supportive structures to help to develop that: the document does not presume that the universities are currently well-placed to fulfill this vision immediately, however, the intention for universities to be an important and enhanced part of the teacher education infrastructure is clear and linked to the ways in which research have been constructed within the National Strategy.

The National Strategy builds on the new Accreditation Criteria (established in 2017) upon which current ITE programs are already based, and which required all providers to be reaccredited through partnerships of both universities and schools. The Welsh Accreditation Criteria for initial teacher education was specific in this regard, laying down not only the requirements for partnerships between universities and schools but also in the role and function of research within the teacher education programs. [Furlong \(2019\)](#) aligns this approach with what [Burn and Mutton \(2015\)](#) have described as "research informed clinical practice": which they distinguish from "research-informed" practice or professional learning seen as trial and error, or reflection based on experience. This approach has implications for schools as they are given the task of providing systematic and structured learning opportunities, as well as implications for universities who have to provide access to research, to theories and to knowledge about excellent pedagogical practice ([Furlong, 2019](#)). In addition, he notes that this will also change how universities and schools will work together "to ensure that there is scope for the professional knowledge of both to be adequately represented, and how that will influence joint planning, supervision and of course assessment and accountability."

The reality of course is that such an approach takes time to embed and achieve, and will no doubt be differently expressed across the accredited providers in Wales. However, the intent to have a system based on research-informed clinical practice certainly has policy support in Wales, even though there are still questions about what is meant by the division between research and professional enquiry, as one teacher educator described:

I think the things that we're coming up against is "what is research?". It's sort of all fallen now under this umbrella of professional inquiry, and whether it needs to be redefined for the practicing teacher. Are we expecting peer reviewed papers, you know, that kind of academic research, or are we going with a more practice led, professional accounts? So, people are kind of muddling through, to be honest. And I think one of the risks is we'll lose our integrity, if we lose the peer reviewed kind of research, and the kind of research that you can submit to REF, we will start to lose the academic field if we're not careful.

The recent experience of ITE providers indicates that while the intention for a research orientation is strong in the policy, there is still some way to go in relation to changing pre-service teachers' expectations. As one colleague explained, they have to recruit teachers locally and those teachers are encultured into a previous learning culture:

In the selection criteria will look for things like openness, willingness to learn all those kinds of things. But mostly we have to recruit very locally. So, we are recruiting the product of a somewhat broken education system. They [the new recruits] are all cut from the performativity culture: "just tell me what to do. Tell me what to write" and all that kind of thing.

The new vision for education in Wales means that during the teacher education process, and through the research-orientation required in the new programs, the teacher educators are seeing a shift in the perspectives of these new teachers as they adapt to the demands of the program:

In week one of the programs, we do assumptions, beliefs, stereotypes, and we are aiming to basically change their mindsets from week one They start off with having those myths exploded and their expectations shifted. And then, as they develop their understanding and experience, by the end of it, you see quite a shift.

The basis for this shift is aligned with the focus in this particular program on four research dispositions which make up an important part of the program and are mapped across both the undergraduate and postgraduate programs:

- being skeptical;
- being ethical;
- being part of an inquiry profession, and;
- having the skills of a researcher or being a researcher,

These are broken down into dispositions and behaviors and mapped across the modules and developed through a professional learning passport and supported by other aspects of the course including professional learning conversations. It is through this

program infrastructure that the program intends to shift the expectations of the student teacher into one of a more “researcherly disposition”, which is then reflected in how they are able at the end of the program to “confidently talk about their decisions in the classroom.”

While the outcomes of the Welsh approach have yet to be fully realized, the progress so far does seem to suggest that a transformation is taking place in how the qualifying teachers at the end of their initial education are engaging with research, particularly as they work in research-engaged schools that can support their understanding of the role and function of research in relation to their practice.

Importantly, a key aspect of the Welsh National Strategy is the recognition of the professional development and investment required for teacher educators to be sufficiently research active to fulfill their obligations. The National Strategy outlined a new Master's degree in Education “that will enable large numbers of educational practitioners to develop their research and enquiry skills,” and a range of doctoral level opportunities for teacher educators and educational researchers. The aim of which is to support not only the research capacity of teacher educators but also to fund research networks, and research itself into education in Wales. It is therefore seen not only as a function support for teacher education but also as part of the educational infrastructure for Wales.

While a commitment to supporting the research capacity of teacher educators is an important initiative in order to support research capacity generally, there is still the question as to whether these proposals address the challenges teacher educators face in becoming research active.

From the experience of teacher educators in Wales, there are still challenges for the ambitious Welsh vision to be realized:

Our expectations of our staff are much more: “don't replicate the classroom here”. We get them to think about what's the university is for? What do we understand by critical thinking and critical debates? Where is that occurring in your practice? We've got better at those kinds of conversations. But I think it's very hard. ... we've just had a whole bunch of new staff. And some of them have been saying, “if only I'd had time to do this when I was a teacher. If only somebody had told me to read this or share this with me or discuss that with me, it would have changed my practice.”

But how we shape them into a teacher educator is quite different. And actually, the skills that you need to be a good teacher educator, are not necessarily the things that you need to write good research report. And those skills don't necessarily translate into how you support schools. Research can be quite an insular experience, almost selfish. Whereas if you're supporting a school, it's much more of an altruistic social collaborative experience.

The question of the capacity of teacher educators to conduct research remains an important one. However, this comparison highlights the distinctive set of skills and professional development needed to be a good teacher educator and to be a good academic researcher. Even when working collaboratively with schools, there are challenges to overcome in how teacher educators are enabled to support the expectations for their role. In particular the question remains as to how research within teacher education itself can develop while the research capacity for teacher educators remains a significant challenge.

Enabling or constraining research capacity

The Welsh National Strategy seeks to enhance and support capacity for research within and across the whole education sector, while the approaches taken by the English government could be described as more prescriptive, narrow, and conservative with a particular stance focused on curated evidence over (practitioner) research. These different examples reveal how policy can create the conditions for research capacity within initial teacher education.

The two contrasting teacher education policy perspectives outlined in detail here are indicative of how the role of research in teacher education, in two quite similar contexts can be enabled or constrained. The detail, while specific to these two geographically connected contexts, is useful in revealing how the trends identified in previous research (the role of universities, the perspective of new teachers, the preparedness of teacher educators and the accountability systems) are replicated and compounded in policy documents. Policy is central in creating the conditions in which teacher educators have to work adaptively in order to ensure that their programs are high quality and effective. Without the work of teacher educators, these policy contexts would be instrumental in determining how research is situated in the process of becoming a teacher, and ultimately how that then frames teacher knowledge and professionalism.

Tatto (2021) makes a strong case for why teacher educators and teachers need to “take back control” of research in education. She argues that without increasing research capacity in this area that education policies will “worsen rather than improve the performance of underserved populations,” that the capacity for teacher educators to be taken seriously within the academy will be reduced and that the “fragile bond” formed by school-university partnerships will be harder to maintain. Moreover:

Instead of faculty working arm in arm with future teachers and together engaging in a research-rich culture of continuous programs of research, learning and improvement, the worlds of faculty and future teachers remain separate The narrowing of the curriculum in teacher education has resulted in teachers' lack of preparation to engage in rigorous evaluation research able to challenge ill-informed non-educationist research and to explore innovative ways of teaching and learning, to, in short, reimagine education.

The analysis presented here shows that a vision of teacher education that foregrounds research is possible at a national policy level, and that while this does not necessarily mean that the documented problems of teachers' research-engagement will be resolved, it does provide an example of how research capacity can be enabled. The analysis also shows what the alternative could look like: a controlled and prescriptive, narrow curriculum which also influences the pedagogy and practice of teacher education, stripping away the role and expertise of teacher educators, ultimately placing government departments in control of what is taught to new teachers. Although contrasting in approach, the policy documents reflect the trends in professionalizing teacher education highlighted by Mayer (2017): in particular in how policies can seek to regulate provision as well as (de)regulate providers, and how Standards (and accreditation) can be used as policy technologies to affect pedagogy and practice.

While the examples of England and Wales are fairly contrasting, they reflect the discourse community of the policy contexts they have emerged from. The ITT Market Review Recommendations have yet to be implemented or even accepted by the British government (at time of writing), but in effect as a document which sets out a series of expectations about teacher education, the potential "damage" to research capacity is stark and clear. This of course has been written in response to the complex and diverse landscape of providers in the English system that has been diversified in this way to represent a faux market, driven by a technicist discourse about what it means to learn to teach. While this technicist approach may seek to solve a short-term problem about teacher supply and demand, it fails to address the much more substantive issues about teaching quality and teachers' adaptive capacity. It is precisely here that research capacity is so important.

The link between research capacity in teacher education and teacher quality are perhaps difficult to quantify. The reality of teacher development is that individual trajectories are so bound up with personal experiences that claims about one approach or another are fairly meaningless when scaled up (as concluded by Grossman and Loeb (2008)). If such a link cannot be made, then the question becomes a philosophical one: what sort of education our society privileges and how it supports teachers to contribute to that.

Acknowledgment

I am very grateful to the Welsh colleague who agreed to be interviewed for this research.

Introduction

The realities of teachers' work and lives have been investigated from a variety of perspectives including the knowledge and skills required of teachers, the impact of (trans) national policies, the changing nature of their professionalism, the perceived image of the teaching profession, school and teaching cultures, etc. (Helsby, 2000; Osborn, 2006; Day et al., 2007; Kelchtermans, 2009; Flores, 2012, 2019; OECD, 2019). Quality has been the common theme, often associated with the need to raise education standards internationally, and also with issues of intensification and bureaucratization, increased forms of managerialism, greater accountability and public scrutiny (Osborn, 2006; Ávalos, 2013; Day, 2017; Flores, 2019).

Existing literature has pointed to the complexity and interplay of the variables impacting on teachers' work and lives in many parts of the world (Flores, 2012; Day, 2017), issues identified including the rise of performative cultures through increased accountability and imposition of standards (Sachs, 2016), the compliance of teachers with the demands of performance policies and the tyranny of audit (Lo, 2012), and the decline in teacher autonomy and an environment of distrust (Sachs and Mockler, 2012). More recently, the outbreak of the COVID-19 pandemic has brought about profound changes in teachers' work as a result of the forced and abrupt shift from face-to-face to remote teaching due to the compulsory closure of schools in an effort to mitigate the spread of SARS-CoV-2. In many parts of the world, the long-term effects of this changed scenario have had a marked impact on the circumstances facing teachers in their work and professional lives. This chapter reports on findings from two studies carried out in Portugal before and during the COVID-19 pandemic in order to illustrate key issues that cut across teachers' work and which need to be considered in discussions about the nature of teacher professionalism.

The multidimensional and changing nature of teacher professionalism

Teacher professionalism has been described as a contested site (Sachs, 2016) since it depends on a wide range of dynamic variables, whether political, professional, or contextual. Thus, the study of teachers' professionalism needs to go beyond a normative perspective and to take into account teachers' views and experiences of professionalism in context (Flores, 2020). Tensions have been reported in the literature between, on the one hand, managerial and top-down understandings of teacher professionalism and, on the other hand, individual, collegial and contextualized responses to the changing nature of teaching (Ávalos, 2013; Day, 2017). Looking at policies that have affected teachers' work in the Portuguese context, Estrela (2014) contends that old and new

professionalisms may be identified, representing both regression and progress in the teaching profession. She asserts that teacher professionalism remains a sensitive issue and warns that teaching might be seen as a risky profession or a profession at risk while, at the same time, it may be viewed as an opportunity for teacher re-professionalization (Estrela, 2014). Similarly, Sachs (2016) identifies the factors that shape teacher professionalism, namely performance management and performance cultures, increased accountability, and the continued imposition of teacher standards.

The two ideal types identified by Evetts (2009), namely organizational and occupational professionalism, are useful concepts for understanding teachers' work in times of intensive school reform and top-down initiatives, indicating the need to improve the quality of teaching and raise student achievement while also highlighting the importance of teacher autonomy and agency. Organizational professionalism is situated within a logic of control, greater public accountability, the use of standardized procedures within hierarchical structures of authority and decision making. This managerial perspective of looking at teacher professionalism includes external forms of regulation, target-setting and performance review and assessment. In turn, occupational professionalism draws on the discourse constructed within professional groups, in which issues of collegial authority and discretion and occupational control of teachers' work are prevalent. In addition, it entails "relations of practitioner trust from both employers and clients and it is based on autonomy and discretionary judgment and assessment by practitioners in complex cases" (Evetts, 2009, p. 23). These two discourses of professionalism identified by Evetts (2009) parallel the notions of managerial professionalism, with a focus on performance and accountability, and democratic professionalism, focusing on collegial relations and collaborative work practices, as identified by Sachs (2016).

In the Scottish context, Reeves (2009, p. 114) analyses three competing forms of teacher professionalism which are "embedded in multileveled and mixed practices in schools": (i) bureau professionalism; (ii) educational operationalism; and (iii) "new" professionalism. The discourse of bureau professionalism involves viewing teachers as experts in their classrooms working in bureaucratic structures. In this context, good teaching means displaying "certain prescribed behaviors that should be used to grade teacher performance as a prerequisite for identifying targets for improvement" (p. 107). As such, control and accountability are key features of this type of professionalism which is to be assured through a "detailed prescription and supervision of performance" within the "implementation of a central determined curriculum, thus setting clear restrictions on the exercise of practitioner judgment and agency" (p. 107). In turn, "educational operationalism" has some similarities with the positioning of teachers within bureau professionalism, namely in regard to their "lack of say over organizational goals and governance and the hierarchical nature of power relations in the education system" (pp. 107–108). Teachers are closely supervised and are seen as compliant operatives. Thus, educational operationalism accentuates the "range of mechanisms for controlling teachers' work and the intensity of their impact" representing a "material alteration of relationships within the hierarchy resulting in a loss of autonomy for teachers" (p. 108).

The notion of "new" professionalism draws on the reflective and collegial role of organizational members. Issues of collaboration and knowledge sharing are key factors as are learner-centered practice; clarity about moral and social purpose; commitment to evidence-informed practice and critical reflection; discretionary judgment exercised both collectively and individually; collegiality and collaboration with colleagues, other professionals, pupils, and parents; commitment to continuing professional development and knowledge creation (Reeves, 2009, p. 108). In Reeves' view, the tensions arising from the co-existence of these three forms of professionalism create opportunities for teachers to reinvent and revitalize new forms of professionalism through "action, argument and alliances within the field of practice" (p. 115). It is, therefore, important to examine further the nature and forms of teacher professionalism in context and the conditions for its enhancement by drawing on the views and experiences of teachers.

Teachers' work and the role of emotions

Emotions are a crucial element in teaching (Hargreaves, 1998; Nias, 1996). They need to be taken into consideration if we are to fully understand the nature of teachers' work and their professional lives. Existing research has shown the importance of emotions in the process of identity development (e.g. Flores and Day, 2006; Lasky, 2005; O'Connor, 2008; van Veen et al., 2005) and in understanding teachers' responses to school reform and educational change (e.g. Hargreaves, 2005; Darby, 2008; Schmidt and Datnow, 2005) as well as their work in the classroom setting (Bahia et al., 2013; Sutton et al., 2009).

In the UK, Jeffrey and Woods (1996) identified professional uncertainty, confusion, anomie, anxiety, mortification and doubt among teachers when they investigated primary school teachers' responses to an OFSTED inspection, associating these with "dehumanization" and "de-professionalism". Other negative emotions were: frustration; anger exacerbated by tiredness, stress and students' misbehavior; anxiety due to the complexity of the job; guilt, sadness, blame and shame at not being able to achieve ideals or targets imposed by others. The study also identified loss of pedagogic values and of harmony, as well as changed and weakened commitment. The authors argue that one possible way to avoid such negative trauma is by shifting identity and status from professional to technician.

Schmidt and Datnow (2005), drawing on sociological and educational theory, examine the emotions teachers mobilize in making sense of educational reforms. Positive and negative emotional responses were found in regard to changes in classroom practices with implications for their role and identity as teachers. Similarly, Darby (2008) looked at teachers' specific emotions in critical incidents that occurred during the period of reform and to explore the reconstruction of their professional self-understanding. She found that teachers experienced fear and intimidation when their professional self-understandings were challenged. She also identified feelings of pride and excitement, which were linked to support from a literacy coach and university faculty, helping teachers to reconstruct self-understandings and leading to improvements in student achievement and in their own instructional practices.

In a similar way, [van Veen et al. \(2005\)](#) examined one teacher's perceptions of educational reform from a social psychological perspective. The authors found both negative and positive emotions. The former were related to anxiety, anger, guilt, and shame stemming from the "lack of time, enormous number of portfolios each semester, and the lack of support from his subject colleagues, school management, and government" (p. 931) while the latter were associated with achievement of goals and purposes in teaching and opportunities to improve teaching and reinforce professional identity.

As [Sutton et al. \(2009\)](#) assert, teaching is an "emotional enterprise" as "teachers may experience happiness when an instructional objective is met or students follow directions, frustration when students cannot grasp a concept, anger with misbehavior, disappointment with lack of effort, and anxiety when competence is challenged" (p. 130). Emotions entail an individual, private and psychological dimension, as well as being socially constructed and situated in relations ([Zembylas, 2007](#)). They concern not only personal dispositions and commitments but are also a product of given ways of organizing teaching ([Hargreaves, 2001](#)). Emotions are, therefore, key to understanding the way in which teachers perceive school reform and educational change but also how they view their role and identity and how they experience teaching in a particular context.

Being a teacher in changed circumstances

The sudden and unexpected shift from face-to-face to remote teaching as a result of the closure of schools due to the COVID-19 pandemic entailed global and local responses to a scenario for which nobody was prepared. Emergency remote teaching ([Bozkurt and Sharma, 2020](#)) was rapidly put in place but a number of difficulties were identified from the outset. Technical problems, lack of adequate equipment and discrepancies in access to technological devices and to internet access have been reported ([Zhang et al., 2020](#); [Flores et al., 2021](#)) with implications for pupils' learning ([NFER, 2020](#)).

Existing literature points to the unexpected digital transformation that students, teachers, parents, school administration and society had to face regarding the development of new skills and resources ([Iivari et al., 2020](#)) and appropriate infrastructures ([Carrius, 2020](#)). Teachers were asked to continue teaching in new scenarios while having to face new challenges regarding communication with students and providing support for students' learning ([König et al., 2020](#)). Issues such as time pressure and increased workload ([van der Spoel et al., 2020](#)), knowledge and skills required in distance learning education, internet access, use of devices for distance learning education ([Alea et al., 2020](#)) and lack of interaction and spontaneity ([Niemi and Kousa, 2020](#)) have been identified. Previous experience in distance teaching explained a more positive adaptation on the part of teachers to remote teaching ([van der Spoel et al., 2020](#); [Flores et al., 2021](#)) as well as support on the part of school leadership ([Judd et al., 2020](#); [NFER, 2020](#)). In addition, teachers' digital competencies have also been explored as well as the need to develop appropriate professional development opportunities in ICT ([Huber and Helm, 2020](#); [König et al., 2020](#)). Other empirical work found that there was a reduction in the perception of teachers' well-being regarding the profession along with concerns related to their professional future ([Alves et al., 2021](#)). In face of such a challenging scenario, it is important to examine how teachers have experienced remote teaching and how it has affected their lives and sense of professionalism.

The studies

This chapter reports on findings from two wider studies carried out in Portugal. The first study was conducted in 2016/2017, focusing on professional standards and professional development, and their impact on teachers' work and lives. This research was funded under grant SFRH/BSAB/114245/2016 (from the National Foundation for Science and Technology). The second study was carried out in 2021 (May–July), after the experience of two lockdowns (2020–2021) and of face-to-face teaching under more challenging circumstances due to sanitary measures such as the wearing of masks and physical distancing. In this chapter, the following questions are addressed:

- What dimensions of their work do teachers value the most and the least, and how do they feel about being a teacher (Study 1)?
- How do teachers view the experience of being a teacher during the COVID-19 pandemic (Study 2)?
- What are the key issues characterizing teachers' work before and during the COVID-19 pandemic (Study 1 and 2)?

Participants

In the first study, 1307 teachers participated, the vast majority of them being female (70.5%) and aged over 45 (69.7%). Most of the participants have between 21 and 30 years of teaching experience (44.1%) (see [Table 1](#)).

In total, the second study had 2192 participants, drawn from all sectors of the teaching profession and most of whom are experienced teachers (see [Table 2](#)). The majority are female (82.2%) and aged over 45 (78.7%). Such figures are in accordance with official and international data. According to the recent TALIS report ([OECD, 2019](#)), the average age of teachers is 44, but in Portugal it is 49. A recent study conducted by the National Council of Education ([CNE, 2019](#)) points to the need to renew more than half of the teaching workforce in the next decade: 52.9% of teachers are aged 50 or over and only 1.1% are aged under 35 ([CNE, 2019](#)). Teaching is also characterized as follows: a highly qualified profession (a master's degree is now required for all entrants into teaching, from pre-school to secondary school), with professional stability (low teacher mobility) but also precarious working conditions (for teachers who do not have a permanent post in a school) and a lack of appreciation for the teaching profession ([CNE, 2016](#)).

Methods

In the first study, an online survey was designed based on a questionnaire developed and conducted by Flores and Van Nuland (2013) and Flores (2014). The questionnaire consisted of six sections and participants were asked to respond to a series of questions using a Likert scale relating to their understanding of the purposes and use of professional standards; dimensions of their work; feelings about being a teacher; opportunities for professional development and motivations to remain in or leave the teaching profession. They were asked about the nature of their work, and from a list of 15 possible areas, to select the five most important aspects of their work as a teacher. In relation to their career-long development, participants were asked to describe two of the most significant experiences of professional learning and development in their career over the last five years. Finally, where relevant, participants were also asked to comment on their experience and work as teachers. Demographic questions were also included.

The second study is based on a questionnaire drawing on previous studies (see Flores et al., 2021; Flores et al., 2021; Ávalos et al., 2021) which contained three main sections: (i) perceptions about the second period of remote teaching (2021) compared with the first one (2020); (ii) perceptions about resources and support; (iii) work experience since the eruption of the pandemic and overall impact. Teachers were asked to rate each item in each section using a Likert scale, in the case of closed-ended questions, and were also given open-ended questions offering them the chance to describe their work and first-hand experience in more detail.

Data collection and analysis

In the case of the first study, a nationwide survey was conducted through an online questionnaire (using SurveyMonkey) which was sent to the principals of all the elementary and secondary schools in mainland Portugal. The questionnaire was then distributed to the teachers in each school. Permission for administering the questionnaire in state schools was previously obtained from the Ministry of Education (ref. no. 0554600001). The voluntary nature of participation was emphasized and confidentiality of the data guaranteed.

As for the second study, the survey was carried out through Google Forms. The invitation to participate and the link to the questionnaire were sent to teachers via their professional associations, unions and teacher centers across the whole of mainland Portugal and the Islands. The project was approved by the Ethics Committee for Research on Social and Human Sciences at the University of Minho (CEICSH 055/2020).

Quantitative data were analyzed through SPSS (version 26). Qualitative data analysis was conducted in two phases: first, an analysis of data gathered from each open-ended question; and subsequently a comparative or horizontal analysis (cross-case analysis) (Miles and Huberman, 1994). In the second phase, common patterns as well as differences were examined. A semantic criterion was used to look for key themes arising from the qualitative data. Key themes and sub-themes were identified. In order to avoid subjectivity, data was validated by at least two researchers. The most frequent trends were then summarized and labeled accordingly.

Findings

In this section the key findings of the two studies are presented in order to capture the teachers' experiences and their views of being a teacher at two specific moments in time, namely before and during the pandemic. Several quotations are used to illustrate the main themes drawn from the open-ended questions.

First study

Appreciation of the pedagogical and collaborative aspects of teaching

The teachers participating in the first study (2017) were asked to select the five most important dimensions of their work from a list of possible areas (see Table 3). It is clear that teachers highlight the pedagogical and collaborative side to their work, the most important issues being motivating pupils, devising new strategies for them to learn better and reflecting on their work in the classroom. Following their work in the classroom the participants also identified their collaborative work with colleagues and professional learning as key aspects of their work. However, only 28.6% referred to participating in the decision-making process, which may be related to a logic of bureaucratic control prevailing in existing structures and a culture of curriculum execution as a result of top-down initiatives within a centralized education system. Teachers feel overwhelmed with the number of tasks they have to perform and with the endless changes in education:

There is so much bureaucracy and it seems that as a teacher you need to do everything. As a teacher, you should devote your time to teaching, planning, organizing and selecting teaching materials, having space and time to work with students ... but much of what you do is paperwork and statistics and reports ... (21 years of teaching)

Table 3 Aspects of teachers' work (Study 1).

	<i>f</i>	%
Motivating students	864	66.1
Devising new strategies for pupils to learn better	811	60.1
Reflecting on my own work in the classroom	702	53.7
Collaborating with colleagues	643	49.2
Enhancing my professional learning	602	46.1
Supporting pupils' learning	595	45.5
Dealing with pupils' behavior	469	35.9
Lesson planning	389	29.8
Participating in the decision-making process in my school	374	28.6
Creating new materials for students so that they can learn better	264	20.2
Sharing materials with my colleagues	219	16.8
Assessing pupils' learning	212	16.2
Communicating with parents	188	14.4
Using ICT in teaching	150	11.5
Doing administrative work (minutes, reports)	17	1.3

I feel unmotivated concerning the policies that are imposed on schools and the ways in which the Ministry of Education treats teachers. (21 years of teaching)

Not surprisingly, completing administrative work was viewed by teachers as the least important aspect of their work. Overall, the teachers participating in the study highlight the core issues of teaching and point out the number of non-teaching tasks that they have to perform which lead them to feelings of disappointment and tiredness as the following quotes illustrate:

Teachers are trained to teach children, to be in the classroom and to do teaching. They are not supposed to do admin work all the time and to undertake admin roles that they do not want but have to do. They have to leave behind their personal life and their family and they cannot even support their own children. (30 years of experience, Study 1)

I miss the time when I was "only" a teacher. My focus was teaching and learning and I had freedom to make choices for the betterment of my students such as projects with the community and so on. (26 years of teaching)

I feel tired, exhausted and with a sense of no hope in teaching. (26 years of teaching)

Sharing materials with colleagues, using ICT and assessing pupils' learning were also among the least appreciated aspects of their work although these are considered to be important for improving teaching and learning in schools and classrooms. This is interesting at a time when the use of ICT and the classroom of the future have been widely discussed. The overemphasis on summative (and external) assessment may explain why the participants do not attach importance to assessing pupils' work even if it plays a key role in improving teaching and adjusting pedagogical strategies in the classroom. Similarly, communicating with parents is cited by participants as one of the least appreciated aspects of their work. This picture changed after the experience of remote teaching during the COVID-19 pandemic as will be shown later in this chapter.

Portraying a negative picture: heavy workload, bureaucracy and tiredness

How teachers feel about their work and their role matters as much as the conditions in which they do their job. Teachers' interactions within their professional contexts entail a political dimension (Kelchtermans, 2005) which is related to their beliefs and emotions and the ways in which they respond to the challenges of the environments in which they work. When asked about how they felt as teachers, most of them reported negative feelings and emotions. Issues such as tiredness and fatigue, lack of energy, disappointment and disillusion, fear and insecurity, sadness, frustration and feelings of giving up, anger, loneliness, anxiety, pessimism and low morale were reiterated in most of the accounts. The following quotes are illustrative of this:

I feel tired and with no energy (the workload is the same or even greater ...); it is more and more difficult to deal with so many demands and with students who have other opportunities to learn in a far more interesting way than at the school. (29 years of teaching)

I feel tired because I have been dealing with changes in teaching for a long time and I cannot see any changes in reality ... (23 years of teaching)

As a teacher, I feel tired and sad. You cannot change what is wrong. There are no models to inspire us. (31 years of teaching)

Teachers are rather pessimistic and express negative emotions when they talk about how they feel as teachers. The reasons put forward for this vary but most of them are related to endless policy initiatives, lowering of their socioeconomic status, the increasingly bureaucratic nature of teaching and the logic of control and accountability also associated with heavy workload and both internal and external pressures to comply with regulations and top-down directives. Bureaucracy, many (unproductive) meetings, large classes, and the lack of social recognition of the profession were reiterated in their accounts. They also emphasized difficulties in maintaining a balance between work and personal life and the lack of career prospects:

Nowadays as a teacher you don't have time for anything even for your family. There is no weekend, you go to bed very late, you need to do prep for teaching, you need to do lots of reports, looking at emails ... it's too much, it's very tiring ... (19 years of teaching)

My perception is that teachers are tired professionally due to the lack of recognition, lack of career progression (in my case 12 years without any kind of progression!), ageing, instability in terms of ongoing legislative texts and top-down directives to comply with, etc. (16 years of experience)

Mixed feelings: positive energy versus disappointment

Other teachers revealed mixed feelings and spoke of both positive and negative experiences. On the one hand, they talked about disappointment and tiredness, which they relate to the policy environment, the lowering of the socioeconomic status of the profession, the lack of career prospects and the lack of appreciation for the teaching profession, especially on the part of policy makers:

I have mixed feelings and maybe even contradictory emotions; sometimes I feel motivated and energetic; sometimes I feel tired with feelings of giving up. (23 years of teaching)

I think I still have energy and willingness to teach but I feel that policy makers do not value my work. I feel tired with so much bureaucracy and I am disappointed with no career progression and having to work until the age of 66. (37 years of teaching)

On the other hand, they still find positive aspects to teaching, which they clearly attribute to their students and their work in the classroom, as well as to feelings of job satisfaction and to intrinsic rewards of teaching. This is in line with earlier research in the context of changes in educational policies marked by bureaucratization in Portugal which showed that negative emotions were related to policy reform whereas positive ones were related to classroom interactions ([Bahia et al., 2013](#)). Some of the teachers participating in the first study also spoke of their core values as teachers and their sense of professionalism, vocation and identity:

My motivation comes from my students and their willingness to learn. (21 years of teaching)

Personally, I feel motivated by teaching and my other roles at school. However, the endless reforms in education have contributed to a negative image of the teaching profession and to devalue the role of the teacher especially in relation to students and parents. (19 years of teaching)

Maintaining motivation in teaching

A minority of the teachers participating in the first study are clearly positive about their work and their role as teachers. Their accounts involve positive emotions which again they relate to a sense of vocation and to the core issues of teacher professionalism such as dedication, care, and the moral and social purposes of teaching. Making students learn, being motivated and energetic, as well as happiness and love for teaching were identified as key elements:

I feel energetic and willing to contribute to the development of my students with creative dynamics ... (21 years of experience).

I feel motivated because I love teaching. (16 years of experience)

Despite my age, I feel energy to keep going in teaching ... I feel curious about the future. (24 years of teaching)

I am definitely motivated and happy to see my students learn. (30 years of teaching)

The focus on students, on their learning, well-being and development is at the forefront of teachers' clear positive experience, which was associated with their professional values as teachers. The collaborative dimension of their work and the contribution teachers can make to the education of children are also reiterated:

I feel motivated because I still believe in teaching and in the key role of the school in children's development and education. (29 years of teaching)

I am energetic because I don't give up. I continue to fight for the betterment of students and for the teaching profession but I feel that only a few of my colleagues are with me. (42 years of teaching)

I feel good about contributing to students' learning, developing their knowledge and potential and working collaboratively with my colleagues. (27 years of experience)

Second study

Teaching in a changed scenario: forced digital learning during the pandemic

While using ICT in teaching was not considered to be a key dimension in teachers' work by the participants in 2017 (study 1), the outbreak of the pandemic in 2020 imposed a new reality. The rapid and unexpected shift from face-to-face to remote teaching as a result of the closure of schools represented a great challenge for teachers. From the very beginning it was plain to see the lack of adequate equipment and resources and the lack of digital competencies on the part of both students and teachers. The need to improvise the classroom in their homes and maintain contact with their students meant that teachers were forced to take up digital learning. This situation arose due to the "emergency remote teaching" which teachers suddenly had to provide at the beginning of the COVID-19 crisis but which also later involved the construction of online tools and resources as well as a more planned pedagogical response. The following quotes are illustrative of the "initial shock" imposed by the pandemic, but also the learning that came about from the experience of doing remote teaching along with feelings of powerlessness, tiredness and loss of boundaries between personal and professional life:

The first time was a moment of "shock" and trying to do everything that was possible to keep in touch with my students, being there for them, supporting them and their families. I was not so worried about the content or the tasks. But it was a moment lived with a lot of stress, tiredness, powerlessness, and loss of balance between my personal and professional life. (...) The second time was much more planned, organized and reflected ... problems were resolved in a quicker and more effective way. Teachers were able to focus, to better plan their work ... students had also developed competencies to deal better with distance teaching ... (22 years of experience).

During the first lockdown, the focus was on changing everything "from one day to the next". We had to adapt "overnight" in order for the students' learning to be affected as little as possible. At the same time, there was a need to manage the family situation (everybody was at home). In the second lockdown, the biggest concern was for students to participate in the synchronous sessions. (19 years of experience)

Teachers' highlight a sense of "discovering a new world" as they became familiar with digital platforms and online educational tools (GoogleMeet, Zoom, Mentimeter, Google Classroom, Teams, Socrative, ...). They highlight the development of digital competencies and the need to learn more about how to teach in the new teaching scenario.

Working extra hours and frustration "at not being able to reach all the students"

Teachers' work and lives were profoundly affected by the pandemic. The sudden shift from face-to-face to remote teaching marked the experience of being a teacher during the pandemic as did the imposition of sanitary rules which teachers had to deal with when schools reopened. The need to keep in touch with the students and get them involved in the activities so as to avoid too much

"learning loss" was stressful for teachers, whose working hours have increased due to time taken up preparing lessons, contacting pupils and their families and managing their daily professional work. Existing findings point to teachers being concerned about their students' well-being and level of learning as well as the financial situation of students and their families to the detriment of concerns about their own financial, personal and professional situation (Flores et al., 2021; Ávalos et al., 2021).

Although teachers recognize that digital learning occurred as a result of their teaching experience during the pandemic, they emphasize the heavy workload, the difficulty to find a balance between their personal and professional lives and an increase in time devoted to teaching preparation. Being a teacher in COVID-19 times, especially during the lockdowns, involved more intense work in direct contact with families in order to better support their students ("being there for them") and, therefore, communicating with parents was seen as a key aspect of their work, which stands in marked contrast to the findings of the first study. Issues reported also included lack of time, difficulties in managing the various roles that had to be performed at home, along with tiredness and fatigue:

From my experience I have learned that working until physical and psychological exhaustion is not good. I used to work for 14 or 15 hours a day during the first lockdown. And this had consequences. Preparing synchronous and asynchronous lessons with tasks for 212 pupils and also the verification of the tasks led me to take medical leave for the first time in almost 30 years of teaching. (...) For me the problem was the countless hours of preparation. (29 years of experience)

I feel overwhelmed and with a sense of professional disenchantment. As a teacher I had to respond to the queries of the various stakeholders at any time of the day or night and even during the weekend. (28 years of experience)

This perception was corroborated by other empirical studies which point to an increase in workload, stress, anxiety, and even burnout (Sokal et al., 2020; Flores et al., 2021) alongside a reduction in the perception of well-being in regard to the profession and an increase of concern in relation to one's professional future (Alves et al., 2021). The difficulty to reconcile family and professional lives and the increased workload (non-remunerated working hours) are reiterated in teachers' accounts along with the lack of support, lack of time and frustration at not being able to "reach all the students":

My experience meant more work, more tiredness and a lot of frustration at not being able to reach all of my students. (5 years of experience)

Lack of support at policy level: reliance on collegiality and collaboration

While the unexpected and sudden transition to remote teaching was marked initially by a sense of confusion and anomie, teachers showed a positive and rapid response. The mobilization of endogenous resources and the dynamics of collaboration and collegiality were reiterated in teachers' accounts. When asked about the support received and the ways in which they have handled the difficulties encountered, the majority of the teachers participating in the second study highlight factors associated with their working contexts, namely: colleagues (69.5%), tutors (teachers responsible for liaizing between students, teachers and families) (63.4%), leadership team (60.9%), department/year/cycle coordinators (59.1%), the principal (58.7%) and the support team responsible for distance teaching in the school (45.7%). Less significant were the contribution of school association centers responsible for INSET (28.6%) and the guidance provided by the Ministry of Education (15.1%). The following quotes point to the difficulties faced by teachers but also to the capacity of schools and teachers to "reinvent" themselves to meet the challenges of the new teaching scenario:

I emphasize the capacity of teachers and schools to reinvent themselves in the sense that, in record time, they were able to respond to distance teaching and all the changes it entailed. (25 years of experience)

I have learned that I need to get round these situations on my own. The Ministry of Education's response was completely lacking in terms of guidance. The documents published in this regard don't say anything. They were vague and schools had to organize themselves. (16 years of experience)

As teachers we were very professional in overcoming the difficulties and obstacles and we helped one another. (22 years of experience)

While schools and teachers were able to respond rapidly and relatively effectively to the difficulties involved in remote teaching, it is, however, possible to identify different forms and degrees of change associated with different organizational dynamics and digitalization cultures (Flores et al., 2021). Collegiality and collaboration were key in how teachers responded to the education crisis caused by the pandemic, and which arise from opportunities to expand their professional capital, particularly their social capital based on cultures of mutual support and collaboration (Hargreaves, 2021).

Capacity for resilience and increased professional learning

One of the outcomes of teachers' experience during the pandemic concerns an increase in digital competencies and greater confidence in using online tools and platforms. When asked about the impact of the pandemic on their work, teachers participating in the second study stress the following aspects: greater reflection on how to teach in new scenarios/contexts (64.9%), access to digital equipment and tools on the part of teachers (64.0%), access to digital equipment and tools on the part of students (63.4%), teachers' digital literacy (60.6%), greater use of ICT and digital tools in face-to-face teaching (54.0%), teachers' professional learning and development (51.4%) and students' digital literacy (49.0%). Their accounts point to opportunities for professional learning and development particularly regarding the online environment but also to the chance of reflecting on teaching in a changed scenario and its implications for their work as teachers and for student learning.

I now have more confidence in using ICT in teaching. I have also reflected on my students' learning needs. (24 years of experience)

My experience during the pandemic has led me to reflect on my practice and how to improve it in the new context. (23 years of experience)

From this experience I take a more profound reflection on my professional practice and how to better support my students. (21 years of experience)

However, they also emphasize, once again, the increased difficulties they had to face during remote teaching due to technical problems and lack of resources, the endless hours devoted to preparation and to establishing contact with students and their families. The experience of remote teaching has highlighted for most teachers the importance of the relational dimension in their work, and their resilience and ability to adapt to a new context:

I was impressed with my capacity for resilience and adaptation. This capacity was felt by the vast majority of my colleagues. (30 years of teaching)

I have reinforced the importance of personal contact with children and the key role of human relations. (34 years of experience)

When you need to adapt to a different reality that you are not used to, you discover creativity, resilience and courage that you didn't know you had. (33 years of experience)

I have learned to give more importance to life. I have also realized that distance teaching does not meet my students' needs. (24 years of experience)

As this last quote illustrates, teachers stress the value of face-to-face teaching which they consider to be irreplaceable even though they recognize the importance of digital learning. The lack of student feedback and the lack of support along with tiredness explain the more negative experience of remote teaching:

Distance teaching was at a given moment a real nightmare. It was very tiring and it brought me a sense of powerlessness as I knew that only a few students were listening to me and were able to follow my teaching. With this experience, which I hope not to repeat again, I have learned to appreciate even more the importance of face-to-face contact with students and colleagues. (21 years of experience)

I have learned to deal with technologies better; I have reinforced my belief about the superiority of face-to-face teaching at all levels: scientific, pedagogical and human. (38 years of experience)

Conclusion and discussion

This chapter has set out to examine the realities of teachers' work and lives drawing on data from two wider research projects. Teachers' accounts reveal that their experience of professionalism, their usual practices of teaching and ways of interacting with students and colleagues have been challenged, particularly as a result of the transition from face-to-face to remote teaching during the COVID-19 pandemic. As a dynamic and contextual process subject to different and sometimes competing

interpretations and “voices” (Helsby, 2000; Hargreaves, 2000), teacher professionalism is determined by macro-level definitions and decisions but it also depends on how teachers experience their work and see themselves as professionals.

Both studies reported in this chapter illustrate how teachers live their profession and what they understand of the experience of being a teacher before and during the COVID-19 pandemic. Findings point to differences but also to similarities. One of the features that clearly stands out from the two studies is the appreciation of collaboration and collegiality, which are seen as essential aspects of teachers' work. While the unexpected and sudden transition to remote teaching was marked initially by a sense of confusion and anomie, teachers showed a positive and rapid response which was due in great part to the mobilization of endogenous resources within schools and local communities as well as the dynamics of collaboration and collegiality. This is emphasized within the context of a perceived lack of support or clear guidance at the policy level thus testing the capacity of schools and teachers to “reinvent” themselves to meet the challenges of the new teaching environment. The translocation of teaching from a classroom setting to online platforms (Ávalos et al., 2021) was an intense experience for teachers as they felt the “initial shock” but also created an opportunity for them to collaborate in order to respond to the demands arising from the sudden closure of schools. Discussing the losses, gains and transformations affecting teachers and teaching due to the COVID-19 pandemic, Hargreaves (2021) stresses, among other features, teachers' professional skills, especially pedagogical expertise, together with their professional capital, and in particular social capital, in relation to how they share knowledge and ideas within collaborative cultures and professional networks.

While, in the first study, teachers highlight the individual and collegial aspects of their professionalism (e.g., collaborating with colleagues, motivating pupils, reflecting on their work, etc.) with a focus on what they consider to be the core issues of their profession (their work with students and peers), they also spoke of managerial and functional issues (e.g., administrative tasks), which they generally consider to be the least important aspects of their work but which influence the ways in which they exercise their professionalism. Their accounts thus reveal features of bureau professionalism and educational operationalism (Reeves, 2009) when they refer to issues of bureaucracy, the amount of paperwork and the lack of autonomy, which is situated within a logic of top-down policy initiatives driven by accountability demands. They tend to see themselves as compliant operatives and point to a loss of control over their work marked by prescriptive and narrow perspectives of teaching alongside pressure from society in general and from policy makers in particular. This trend is associated with how teachers see the profession from within and how it is viewed from the outside, particularly from the perspective of policy makers. In other words, tensions between organizational and occupational professionalism emerge (Evetts, 2009) with an emphasis on the former, as top-down policies, formal procedures, managerialism, and hierarchical and bureaucratic structures influence teachers' capacity for action. This may be seen, for instance, in the first study when teachers indicate that participating in the decision-making process is not one of the aspects of their work that they most appreciate. Such a view is to be understood within a logic of bureaucratic control prevailing in existing school structures and within a culture of curriculum execution as a result of top-down initiatives within a centralized education system. Their accounts illustrate the inner tensions of being a teacher in scenarios which are marked by contradictory trends: the focus on teaching and on students' learning needs and well-being, on the one hand, and the pressure for immediate results within a logic of greater accountability and control on the other hand (Ben-Peretz and Flores, 2018; Flores, 2020).

The complex and demanding realities of teaching are described with strong emotions. Teachers feel overwhelmed by policy initiatives and the greater demands and pressures over their work associated with the increased bureaucracy in teaching and endless reforms which impact on their subjectivities and understandings of professionalism (Gewirtz et al., 2009). In the first study, they spoke of disappointment, tiredness, lack of energy, fear, sadness, frustration, loneliness, anxiety, and feelings of giving up. These are experienced within a context of greater demands and excessive workload along with the lack of career prospects, lack of recognition of the teaching profession and the lowering of their socio-economic status (see also Flores, 2020). Issues of stress, fatigue and frustration at “not being able to reach all the students” are also reported in the second study and again corroborate the overall negative picture of the experience of being a teacher. This is in line with earlier empirical work focusing on emotions inherent in teachers' response to external pressures (Jeffrey and Woods, 1996) and with recent research which points to an increase in workload, stress, anxiety, and even burnout associated with teaching during the COVID-19 pandemic (Sokal et al., 2020; Flores et al., 2021) alongside reduced perception of well-being in regard to the profession and increased concern among teachers about their professional future (Alves et al., 2021).

However, positive aspects were also identified when teachers in both studies refer to their work with students. They talk about energy, motivation, satisfaction and willingness to carry on. The focus on students' learning and well-being are at the forefront of their accounts pointing to a sense of vocation and their identity as teachers. At the center of their professionalism are their core professional values, in particular the moral and social purposes of teaching, care, dedication and commitment to students' learning and well-being. Such findings point to the relational dimension of teaching and to the “ethics of care” (Noddings, 1984) and corroborate other research underlining how teachers' experiences of caring are influenced both by their need to sustain positive professional relationships with their students and by their individual beliefs about their role as a teacher (O' Connor, 2008). Such issues were also reinforced in the second study as students' well-being was of greater concern to teachers (“being there for them”) than their own problems (see also Flores et al., 2021; Ávalos et al., 2021). The experience of remote teaching is, therefore, accompanied by an emphasis not only on the non-cognitive aspects of teaching related to personal factors but also on the relationship with students as well as the emotional dimension of teaching (Hargreaves, 2021; Ávalos et al., 2021).

Another feature revealed by the data from the two studies concerns technology. While using ICT in teaching and communicating with parents were among the least appreciated aspects of teachers' work in the first study, the COVID-19 pandemic has completely changed this picture. Due to the shift from face-to-face to remote teaching as a result of the closure of schools, technology has assumed a pivotal role in teaching and in teachers' interaction with students, colleagues and families. The "initial shock" and the need for teachers to get round the situation overnight without the required time for preparation or reflection led them to a forced digital learning. This "discovery of a new world" meant that they had to get to know the necessary online tools and platforms in order to be able to teach and interact with students and colleagues. Clearly this experience represented an opportunity for teachers to develop digital competencies and adapt their usual ways of teaching to the new circumstances. However, as other research suggests, if the response by schools and teachers to the unexpected and sudden transition from face-to-face to remote teaching was generally effective, it also revealed different paces and processes of adaptation associated with different organizational dynamics and digitalization cultures (Flores et al., 2021). For instance, earlier empirical work concluded that prior experience in distance teaching explained a more positive adaptation to remote teaching on the part of teachers (van der Spoel et al., 2020; Flores et al., 2021b) and that support provided by school leadership (NFER, 2020) and collaboration with colleagues (Delcker and Ifenthaler, 2021) were key influential factors.

Overall, the need to develop digital competencies in teacher education, during both initial and in-service training, has been identified as one of the lessons learned during the COVID-19 pandemic. It is, however, essential to move beyond an instrumental approach to technology and to consider its ethical, political and pedagogical dimensions. This implies moving beyond the questions of "what" and "how" and to consider the "why", "who" and "for what purpose" in order to transcend the bureaucratic (Reeves, 2009) and managerial professionalism (Sachs, 2016) which is marked by a logic of standardization and replication.

If the COVID-19 pandemic had implications for the ways in which we view education and teachers' work, it is also true that we must not forget the problems and challenges that already existed prior to the pandemic. In particular, it is important to consider the conditions for teaching and learning in schools and classrooms, especially the necessary equipment and resources, and how policies affect, and even undermine, curriculum innovation and pedagogy as well as teachers' professional autonomy and collaboration, two key components of teacher professionalism. Teachers should have a say in the definition of their professionalism but also in the direction and focus of their professional growth. This is also something that teachers participating in the two studies acknowledge when they identify professional learning as one of the key aspects of their work. The experience of being a teacher during the COVID-19 pandemic has also entailed a process of learning that teachers tend to appreciate despite the challenges that they had to face when they were obliged to teach and work together in changed circumstances. Therefore, relevant support, including time and resources, and appropriate opportunities for professional development are crucial to enhance more collaborative professionalism (Hargreaves and O' Connor, 2017) and to expand new spaces for joint professional learning and collective action. As Darling-Hammond and Hyler (2020) assert, there is a need to invest in high-quality educator preparation, transforming learning opportunities for professional educators to match current needs, supporting mentoring and the development of new teacher roles, and creating time for educators to collaborate with each other and key partners. While the COVID-19 pandemic has exposed the fragilities of education systems, it has also provided an opportunity for professional learning and enabled the emergence of creative and contextualized responses that need to be continued. But for this to happen, it is necessary to go beyond contingent and temporary responses to a crisis in education such as the one that the COVID-19 pandemic has imposed on teachers. It requires the consideration of teachers' voices, their capacity for action, and investment in policies of teacher education that are consistent and congruent with sophisticated and complex views of teaching and of teachers' individual and collective agency.

Introduction and framing

In March 2020, the COVID-19 pandemic brought about an immediate “quasi-systematic closure of schools” around the globe (OECD, 2021). Educators rapidly adapted their practice to the new conditions of teaching and learning. These closures affected more than 1.6 billion students and 63 million teachers worldwide (United Nations, 2021), but resulting forms of schooling varied across space and time. Although significant research began early in the pandemic to explore the effects on student learning, scholars paid less attention to the changes in teaching and the effect on teachers. Hargreaves (2021) reflected, “While a lot of the post pandemic [learning loss] debate has focused on adding learning time, increasing technology use, and retaining or reintroducing testing as ways to compensate for learning loss, far less attention has been paid to the short-term and long-term impact of the pandemic on teachers and teaching” (p. 1836).

This chapter addresses the transformation of teachers' work during the COVID-19 pandemic and the possibilities—or missed opportunities—for these shifts to translate to educational change. Birkland (1998) has examined the relationship between “focusing events” and large-scale change. Focusing events can help induce change by revealing deficiencies in existing policy and reconfiguring subsystem dynamics. This chapter draws on Birkland's framework to describe the shifts in teachers' work brought about by COVID-19 and how these short-term changes may reshape educational policy in the long run. Due to the pandemic, ruptures in teachers' work affected three principal domains: *teachers' working conditions*, the *pedagogical work* of teaching, and the *relational work* of education.

This analysis draws from a longitudinal study of teachers working in the United States during the pandemic. From spring 2020 through summer 2022, the Suddenly Distant Research Project (SDRP), designed and conducted by the authors of this chapter, chronicled and analyzed the experiences of seventy-five teachers in public schools in nine different US states. Researchers selected states for a variation on two criteria that suggested potential differences in local experiences: COVID-19 death rates as of early summer 2020 and the strength of teachers' unions (Winkler et al., 2012). Teachers were sampled to capture variations in grade-level teaching, subject matter, and community geography within each state. While not a representative sample, the research mirrors the demographics of the US teacher population (Tae and Gldring, 2020). Data collected, including teacher interviews, surveys conducted twice annually, and an ongoing policy and social context analysis, allowed detailed documentation of teachers' lived experiences over time, variation by context, and similarities that transcend context.

Findings from SDRP are the starting point for analyzing the three critical issues addressed in the sections below: working conditions, pedagogical practice, and relational experience. Each unit introduces significant empirical findings expanded from the project data to include and consider related research conducted during the pandemic. This analysis is rooted in the experience of US teachers and endeavors to situate that experience with parallel and corresponding research in other countries. By considering the extent to which SDRP findings are echoed, refuted, or complicated by related research within and across national contexts, this chapter also presents a fuller picture of teachers' work experience during the pandemic. This work highlights teacher self-reports and includes large-scale data sets that reveal patterns in work experiences, even when teachers were not the primary respondents.

Shifts in teachers' work amidst COVID-19

In the spring of 2020, the initial shutdown of brick-and-mortar schooling across the globe was centralized and swift. From March until June of 2020, all teachers in the SDRP sample taught remotely, as did nearly all teachers in the US and elsewhere (Hargreaves, 2021; Kraft and Simon, 2020; OECD, 2021). Remote teaching encompassed a range of virtual activities, both synchronous and asynchronous, but also—especially where technology resources and internet connectivity were lacking—through print materials, educational television, and radio programming (UN, 2020). According to a 2020 UNICEF study in 71 countries, less than half of the countries' population has access to the Internet. Even in countries with high internet connectivity, inequitable access to digital devices created a divide in learning opportunities between the wealthy and the poor (OECD, 2021).

Efforts to reopen schools in fall 2020 spawned a range of remote, hybrid, and in-person arrangements, each with affordances and challenges. Despite persistent surges in the pandemic, state and local systems rapidly and comprehensively restored pre-pandemic expectations concerning student attendance, standards-based curriculum coverage, grading, and testing. In the United States, politics shaped school district decision-making as political partisanship was associated with district reopening plans (Hartney and Finger, 2020; Grossmann et al., 2021). In fall of 2020, 47% of US schools were in a hybrid model (a combination of remote and in-person instruction), 33% were providing fully remote instruction and 20% were fully in-person (Diliberti and Kaufman, 2020). Hybrid models themselves varied as well. Some approaches required teachers to juggle teaching groups of in-person and remote students simultaneously, while others involved teaching in only one modality, with critical implications for teachers' work (Bartlett, 2022). While the fall of 2021 started out with more than three-quarters of U.S. districts offering only full time in person schooling, these schools still struggled with high pandemic-related student and staff absenteeism, necessitating on-going access modifications to teaching practice (Herold, 2021; Santibanez and Guarino, 2020).

The spring of 2020 initially held some promise of increased teacher flexibility and independence. School administrators entrusted teachers to design the content and structure of distance learning based on understanding of their students' needs, often with little administrative oversight or direction (Bartlett et al., 2020). However, as the pandemic progressed, many teachers reported increased administrative demands on their time, heightened pedagogical scrutiny, and lessened control in relationships with students and families (Diliberti and Kaufman, 2020; Thompson, 2021; Jones et al., 2022). These increased demands continued as teachers moved back into the classroom and were required to manage hybrid learning configurations and enforce masking and social distancing measures, often with little input into school reopening plans (Diliberti and Kaufman, 2020; Shah, 2021). We posit that teachers' work experiences during the pandemic are part of a history of teacher labor intensification and decreased teacher autonomy over the last four decades (Apple, 2009; Hargreaves, 1994; Wong, 2006; Ballet et al., 2006; Fitzgerald et al., 2019).

In the sudden shift to distance learning during the spring of 2020, teachers were charged with making critical decisions about content matter, lesson delivery format, and class structure. Teachers had little experience teaching in a fully remote capacity prior to the pandemic—for example, in a study of 239 U.S. teachers and 574 Norwegian teachers, 92% of US teachers and 67% of Norwegian teachers had not previously taught online (Gudmundsdottir and Hathaway, 2020). Despite this lack of prior experience, Gudmundsdottir and Hathaway highlighted the "agentic stance" that teachers adopted in their capacity to "go the extra mile to move teaching to online platforms" (p. 244). However, while teachers from the SDRP study (Bartlett et al., 2020) reported some transition support from technology specialists, school librarians, and other teachers, they were left mainly "to learn on the fly" during the spring of 2020. In one snapshot of this independence, 60% of teachers in the SDRP study reported a high level of flexibility in shaping their daily and weekly schedule in spring 2020. An SDRP teacher reflected, "We were just expected to make it work."

However, as the pandemic progressed, educators described increased administrative demands on their time, heightened pedagogical scrutiny, and lack of input into school reopening plans despite the earlier authority over critical decisions (Diliberti and Kaufman, 2020; Thompson, 2021; Wilson et al., 2020). Teachers' diminished sense of autonomy over working conditions, pedagogical decisions, and relations with students during COVID-19 can best be understood in the longer history of teacher labor intensification (Apple, 1986; Hargreaves, 1994; Ballet et al., 2006; Fitzgerald et al., 2019) and deskilling of teachers' work (Apple, 1986; Wong, 2006; Chakraborti, 2013). The notion of teacher work intensification, originally outlined by Larson (1980) and further developed by Apple (1986) and Ballet et al. (2006), pointed to the "bureaucratically driven escalation of pressures, expectations and controls concerning what teachers do and how much they should do within the teaching day" (Hargreaves, 1989, p. 23), which is seen "most visibly in the chronic sense of work overload that has escalated over time" (Apple, 2009, p. 188). As these demands on teachers' time have risen, teacher control over curricular and other classroom decisions has eroded. Scholars trace the disempowerment and deskilling of teachers to a process that began in the 1980s (Chakraborti, 2013, p. 185).

These changes occurred within the market-centered transformations of schooling throughout the past four decades, which brought about attempts to tailor education more closely to industry and corporate goals (Klees, 2017; Easthope and Easthope, 2000; Watkins, 1994). Gewirtz (1997) remarked, "The labor process of teaching has always been intense ... what is different in this age of market forces and managerialism is the pattern and texture of intensification—the nature of the tasks that are absorbing increased quantities of teacher time and emotional labor." Decades later, this market-centered logic has continued to inform policy and constrain teachers' work (Klees, 2017). Sahlberg (2016) analyzed the global nature of these transformations, labeled the "Global Education Reform Movement," which is characterized by market-like competition within education systems, standardization and control over teaching and learning, and the use of corporate management models.

At the same time, Ballet and Kelchtermans (2009) emphasized how "teachers do not blindly accept [policy] changes but interpret them using their personal opinions about 'good education' and their sense of competence as a starting point. Such sense-making 'filters' the calls for change" (Ballet and Kelchtermans, 2009, p. 1154). Thus, teachers mediate work intensification through

their process of interpretation and sense-making, which are influenced by organizational working conditions (Ballet et al., 2006). Ballet, Kelchtermans and Loughran also posited that teacher work intensification stems from multiple sources, including both external and internal demands. Their analysis aligns with Coburn's (2001) work on how teachers co-construct understandings of policy and negotiate its implementation through their daily interactions. Fitzgerald et al. (2019) built on Ballet and Kelchtermans' (2008, 2009) scholarship to explore in "fine-grained" ways the differences in work intensification experiences, including distinctions in socio-educational school status, primary or secondary teacher orientation, and local context.

These calls for attention to how teachers have experienced intensification and lessened autonomy in different ways across contexts are useful for understanding teachers' varied experiences during COVID-19. However, when teachers faced these increased demands during the pandemic, they resisted them through creative pedagogical, relational, and personal strategies. Such adaptations allowed teachers to connect with students from a distance and protect their time (Bartlett et al., 2021). Teachers prioritized ethics of care for students despite the lack of physical proximity (Jones and Kessler, 2020), used inventive strategies to engage students even when learning configurations were designed without teacher input (Bartlett et al., 2021). Teachers also led sickouts and demonstrations to influence COVID-related decisions by administrators and elected officials.

In continuation with the history of teacher labor intensification and decreased autonomy, teachers' experiences during the pandemic help to illuminate potential longer-term shifts in their work. In what follows, we explore these implications across three domains: working conditions, teachers' pedagogy, and teachers' relational work.

Teachers' working conditions during COVID-19

The literature on teachers' working conditions has established the dynamic interplay of occupational norms, institutional policies, and social aspects of the workplace and profession that affect teachers' work engagement and career commitment (Merrill, 2021; DeAngelis and Presley, 2011; Ingersoll, 2001; Johnson et al., 2012). This section explores two essential aspects of the radical disruption of teachers' work and their implications for teachers' job satisfaction and commitment. First, it considers how the pandemic intensified teachers' work, the effect on working hours, increased teacher learning demands, and the burden of related stress and anxiety. In addition, it explores how teachers' experience of work intensification was amplified by their lack of voice as schools re-opened. It illuminates the manner in which educators navigated and contested these shifting circumstances. Specifically, it contrasts the early days of the pandemic, when teachers were granted increased autonomy and flexibility to identify and respond to students' needs, with the subsequent exclusion of teacher input over re-opening decisions and instructional modality structures. Teachers' experiences during the COVID re-opening correspond to past tensions over the control of teachers' work (Ingersoll, 2009; Apple, 2009).

Work intensification

The pandemic intensified teachers' work as they made rapid changes to their teaching practice in a dramatically altered work context charged with the associated stress of a world health crisis. Teacher work intensification is characterized by a lack of time, chronic and persistent work overload, the replacement of time spent teaching students with administrative demands, the enforced diversification of expertise, and the reduction in professional curriculum discretion (Hargreaves, 1994; Easthope and Easthope, 2000). One thread of pandemic-related research on teachers' experience focuses on determining the degree to which changes to school schedules and delivery models increased or decreased teachers' working time. Several reports found teachers working hours increased in the early days and continued through the pandemic (Kaufman and Diliberti, 2021; Kurtz, 2020; Long, 2020). Other reports showed a decrease in working hours at particular points in the pandemic (Gicheva, 2021; Herold and Kurtz, 2020). However, pertinent scholarship has further explored whether and how the quality of teachers' work was affected and intensified. Jones et al. (2022) contend that the pandemic changes dramatically redirected teacher work time in ways associated with lower job satisfaction. Notably, teacher time spent in instructional practice with their students decreased to 17% from 52% in the pre-pandemic. Time spent on administrative tasks, contact time with administrators, and communication with families increased. The SDRP data indicated a similar escalation of complexity, with 75% of teachers in November 2021 reporting overwork and exhaustion. These feelings were attributed to the intensity of the learning demands associated with instructional modality changes, the collapse of the boundaries between work and home, and the stress and anxiety of situational uncertainty and instability. In these ways, teachers' work was intensified in its complexity even when it did not increase in duration (Wilson et al., 2020; Fitzgerald et al., 2019).

The pandemic required many teachers to develop new technical skills and knowledge, often while physically removed from the regular structural supports for their work and under the duress of the pandemic. Changes in instructional delivery models required teachers to develop substantial new technical and related instructional skills. A 2021 OECD survey of teachers' experience in 37 countries reported that fewer than half (43%) felt "well prepared" or "very well prepared" to integrate technology into their teaching before the pandemic. Relatedly, in July 2020, more than half (54%) of 757 U.S. teachers surveyed reported having no previous experience with online teaching (Bartlett et al., 2020). Only 3% indicated they had substantial online teaching experience. And yet, in November 2020, 95% of SDRP teachers reported their schools were fully remote or operating in some form of hybrid instructional mode. Even the few schools that adopted in-person learning options reported supporting quarantined students through remote instruction. This rapid shift to simultaneous remote and online education represents a massive increase in teachers' technical

abilities during high stress and compromised institutional capacity. During the pandemic, experienced teachers found instruction challenges akin to being a “1st-year teacher” again.

In a survey of over 10,000 Australian teachers, respondents identified a work intensification resulting from a sharp escalation in the complexity of their work and an increase in administrative tasks, along with a sense of feeling undervalued by the government (Wilson et al., 2020). The research found that this complexity was compounded by the stress of working in “Covid-wary classrooms” and, noted the demands of up-skilling, the shift to teaching via remote learning. In March 2020, over 80% of responding SDRP teachers indicated they spent more time on lesson planning, changing instruction, communicating with students and families, attending school meetings, and grading.

These complexities were unfolding in a new stretched out workday that saw teachers working at all hours of the day to accommodate parents' working schedules and encourage student engagement. In the spring of 2020, a school day that formerly had a clear start and end time now extended into the evening with an elementary teacher describing “there was just no cut-off.” SDRP teachers of teenagers reported students often did not show up during regular school hours. One high school teacher described that after the official workday ended then:

Messages would start trickling in from the kids who were just waking up or just got off work—whatever it was—and I would just keep answering them. I mean everybody was so stressed and I wasn't sleeping well. I would get messages from kids at one or two in the morning and I'm already on my phone. The notification pops up and I'm like, “OK, I'll just answer you.”

The stretched-out workday was compounded for parenting teachers, especially mothers, who found themselves doing double duty. Teaching is, in most countries, gendered work historically considered compatible with family responsibilities (Lortie, 1975; Ingersoll et al., 2018). In the US, the teacher workforce is 77% female and in most parts of the world women comprise a large and increasing share of the profession (Le Nestour and Moscoviz, 2020; OECD, 2022). Thirty-one (41%) of the SDRP teachers had dependent children at home; four fathers and twenty-seven mothers. A survey by the Pew Research Center, found that working mothers assumed more childcare duties than working fathers during the pandemic, even when both parents were working from home (Igielnik, 2021). Other studies have corroborated the unequal division of domestic labor during the pandemic and the lasting effect this might have on women in the workforce (Aaronson et al., 2021; Bateman and Ross, 2021; Tedeschi, 2020).

Nineteen of the twenty-seven SDRF female teachers were the primary or sole domestic care providers. This was true even when these teachers had partners also working from home. As one elementary school teacher with school-aged children described, “My husband was also forced to stay home for work ... so he tried to help. But his schedule is not that helpful for my own children. And he doesn't know all the programs and the ins and outs. So, it was kind of left up to mom and teacher and that was a big struggle.” Another teacher, also the primary caregiver, described, “So it was one or the other. I could be a teacher to my fourth graders or I could be a parent to my kids, but I couldn't be both.” She explains the consequences of competing role demands on her sense of efficacy, “So that's another thing I think that's important. That's a piece that played into the emotion and the exhaustion as well. Feeling horrible as a parent and feeling crappy as a teacher. And then there's a pandemic and I don't want people to get sick.”

The pandemic also created generalized anxiety and stress that heightened work intensity. In March 2021, 82% of responding SDRP teachers (N = 71) indicated they were experiencing more or much more stress than they were pre-pandemic. They worried about student well-being, their capacity to meet student needs, and the health risks of everyone. Stress levels stayed high even into the third school year affected by the pandemic. In November of 2021, even after 85% of teachers (N = 62) had returned to teaching predominantly in-person, 47% indicated their work-related stress levels were higher than, and 31% reported the same levels as, during the 2020–21 school year. These same samples self-identified key aspects of affect associated with professional burnout: 52% indicating in November 2020 an increased cynicism about their work as a teacher, 44% a diminished capacity to support others, and 62% a diminished sense of success as a teacher. In a longitudinal study of four Texas high schools, Jabbar et al. (2021) found high degrees of increased work-related stress and signs of burnout reported by 80% of responding teachers. Based on a US sample survey, Pressley (2021) identified anxiety about COVID-19 and teaching demands as two of the four predictive variables for teacher burnout during the pandemic. Other research similarly found feelings of professional loss, uncertainty, and increased burnout risk exacerbated by the pandemic disruptions to teachers' understandings of what it means to be a teacher, the increased work demands, and the decline in the relational aspects of schooling that make teaching enjoyable (Reich et al., 2020; Steiner and Woo, 2021; Kauffman and Diliberti, 2021; Alves et al., 2021).

Teacher voice and control over working condition

As teachers experienced this intensification of work demands, they also navigated an eroding sense of control over their work. At the start of the COVID-19 pandemic, teachers were charged with swiftly adapting all aspects of their work to a remote context with little administrative oversight. One teacher from the SDRP study recalled, “We were given 2 h to switch to distance learning.” Teachers described a high degree of autonomy to shape teaching and learning conditions in this initial period. In a spring 2020 study by the Alberta Teachers' Association in Canada, 80% of teachers agreed or strongly agreed that they had “a great deal of professional autonomy with how to teach my students during the pandemic” (Hargreaves, 2021, p. 31). In another snapshot of this autonomy, 60% of teachers in the SDRP study reported complete flexibility to shape their daily and weekly schedules.

Yet as the pandemic progressed, teachers described heightened accountability measures and a lack of influence in shaping plans for the 2020–21 school year, particularly related to school re-opening and instructional modality structures. Apart from the role played by unions or teacher associations, local districts and schools established few mechanisms for teacher input into fall 2020 reopening plans. An SDRP teacher summed up her frustration:

There was no teacher input. So, when we started to hear the [fall reopening] plan, it was kind of like, “Why? What would make you think that was a good idea?”

Only about one-third of SDRP teachers felt that teachers had been solicited in any meaningful way for their input. While some were satisfied with reopening plans (24%), others reported mixed feelings and a quarter was so unhappy they were contemplating leaving teaching. These findings were mirrored in a RAND study of over 1000 U.S. teachers. Most teachers were dissatisfied or had mixed feelings about their districts’ decisions regarding remote or in-person learning ([Diliberti and Kaufman, 2020](#)).

An OECD report (2021) on how countries managed the response to COVID-19 in education revealed that, while more successful systems involved collaborative decision-making structures across all levels, less successful responses subjected educators to contradictory and constantly changing policy mandates. During the 2020–21 school year, 88% of SDRP teachers experienced some change to the schooling format throughout the year, and for almost one-third of teachers, the school format changed four or more times. Teachers were significantly affected when these decision-making processes were opaque or did not involve educators’ input. One SDRP teacher remarked, “Our district has continually changed protocols and decisions that were very much not founded in science and safety but instead appealed to the loud voices in the community.” Another SDRP teacher lamented, “I am deeply saddened and frustrated by my district’s response and honestly am very defeated by their lack of communication, planning, and response to teacher’s concerns.”

Teachers contested and creatively resisted these increased demands individually and collectively. Some teachers used strategies to circumvent particular policies they did not support. For example, one SDRP high school teacher disagreed with his district’s mandate that teachers report to and teach from their empty classrooms during remote learning. He contested the policy while avoiding disruption to student learning by drawing on his bank of sick days to remain at home while continuing to deliver lessons. He explained: “The kids are still learning and I’m not going to the building. So, it was a win-win for everybody, in my opinion.” Teachers also organized collectively to demand better working conditions and protections ([Mavhunga, 2021](#); [Will, 2020](#); [Mehéut, 2022](#)). Another SDRP teacher reflected:

I don’t feel that teachers are being heard. And I actually started some resistance ... I sat in on a meeting with teachers across the state and people were saying they’re scared and worried. And so, I ended up starting a group—we call ourselves The Motor Marches, and we organized all the marches, the motor parades that went on throughout the state.

In these ways, teachers both influenced and were influenced by the policy changes related to COVID-19, aligning with [Ballet et al. \(2006\)](#) analysis of how teachers make sense of and “filter” education policy change. Teachers’ experiences during the pandemic fit within a history of tensions regarding the control over teachers’ work. At the start of the pandemic, the autonomy granted to shape their daily schedules, lesson structure, and other working conditions departed from decades of tightened controls over teacher labor ([Ingersoll, 2009](#)). However, the subsequent erosion of teacher autonomy alongside teacher experiences of work intensification reinforced these broader patterns and exacerbated burnout conditions.

Teachers’ pedagogy

The substance and scope of the curriculum and the face of teaching both changed as teachers first accommodated the constraints of teaching remotely and then navigated the various instructional configurations that marked the 2020–2021 school year. In surveys and interviews, SDRP teachers highlight four aspects of teachers’ pedagogical experience during the period of school closure and then with the partial or full reopening of schools: the immediate pivot to and continuing reliance on digital technology; instructional adaptations and accommodations that rendered “active learning” difficult to plan for and organize in remote and hybrid arrangements; challenges associated with hybrid instructional configurations introduced by schools and districts as schools reopened; and the variation in available resources and in experiences associated with student demographics (race, ethnicity, and socio-economic levels) and community context. In these four respects, findings from the SDRP study parallel those from other COVID-related research.

Digital technology: a crucial resource and a learning curve

The pandemic swept the world at a time when online learning management systems and digital teaching and learning tools were increasingly common features of the schooling landscape. Many districts and schools, although certainly not all, had invested in

devices for students and teachers. Technology-related professional development opportunities had proliferated. Yet teachers brought to remote teaching very uneven levels of prior experience with online platforms and other digital tools. Some teachers—although a small minority—entered the shutdown with substantial experience using Google Classroom, other online platforms, or digital tools to support student learning in the classroom. However, even those teachers had not used such systems and tools to teach entirely from a distance.

Teachers reported some transition support from technology specialists, school librarians, grade-level and subject-specific colleagues, and from online sources such as Facebook teacher groups. However, they were still primarily on their own to master new learning platforms and digital tools. The experience of the SDRP teachers mirrors that of teachers elsewhere. An OECD survey of teachers' experience in 37 countries reported that fewer than half (43%) felt "well prepared" or "very well prepared" to incorporate technology in their teaching (OECD, 2021; see also Woltran et al., 2021). By the time schools attempted to re-open, many teachers had taken part in professional development using virtual platforms and digital tools. In one large-scale survey of a nationally representative sample of US teachers, 62% said they had received training on using the technology. However, fewer teachers found that professional development focused on promoting academic learning or engaging and motivating students from a distance (Hamilton et al., 2020).

Adapting curriculum and instruction

In the early stages of the pandemic, schools and districts concentrated on reviewing content already taught, noting students' uneven access to technology and other conditions that might affect student participation (Herold and Kurtz, 2020). Despite that policy stance, most teachers in the SDRP sample (75%) introduced some new content, and a few reported introducing all new content in the spring of 2020. Yet they also acknowledged that not all their students—and in some cases very few—accessed that content or completed assignments. A common refrain about new content was that it was "made available" but few students engaged with it. Over 90% of SDRP teachers, including those who had introduced "substantial" new content, taught less content than they would have otherwise and made selective decisions about what content to prioritize. One consideration was the perceived difficulty of teaching particular content without the support afforded by in-person instruction. RAND's nationally representative sample of teachers found that only 12% reported covering all or nearly all the curriculum they would have otherwise covered (Hamilton et al., 2020). No-harm policies adopted by districts in spring 2020—especially restrictions on grading and relaxed student attendance requirements—complicated teachers' efforts. In most cases, student participation plummeted—most drastically among students from lower income households, students with special needs, English Language Learners, and students who were already struggling academically.

Teachers at every level found themselves forced to modify the instructional strategies they had honed, often over decades, to support student learning. In every instance, the pedagogical shift represented a move away from what could be considered active learning—learning that entails substantial student-to-student collaboration, sense-making, and problem solving. A middle school math teacher, unable to organize students in small groups and foster student-to-student sense-making, and forced to supply explanations and teach explicit procedures, said, "I got really good at exactly the kind of teaching that I don't believe in. I figured out procedure-oriented goals because that's the only thing that I had any confidence in when there was no opportunity for [classroom] discourse." An elementary teacher complained that without rich classroom discussion, the quality of students' work went down, and added, "I think the quality of *my* work went down."

Other qualitative research yields similar portraits. Horn and McGugan (2020) interviewed 11 secondary mathematics teachers who had expressed and demonstrated a commitment to ambitious and equitable teaching: an emphasis on conceptual understanding, use of rich mathematical tasks to elicit and build on student thinking, opportunities for student collaboration and rich mathematical discourse, and efforts to foster students' cultural and academic identities. Teaching remotely, the teachers struggled to create lessons, assignments, and assessments consistent with those commitments, and to engage with students in ways that enabled collaboration and invited discussion. The teachers who attempted live synchronous instruction found themselves stymied when students kept cameras turned off, a common experience among the SDRP teachers as well. In the classroom, teachers observe body language and facial expressions to gauge a student's cognitive understanding or emotional state; with cameras off, teachers found themselves teaching to "a sea of black boxes," or a "blank screen."

Although many teachers discovered a range of new online resources and invented new ways of conducting instructional activities in a remote or virtual environment, they still found the experience far less satisfying than being in a classroom. The pandemic transformed teaching from a highly embodied, interactive experience in the intensive immediacy of the classroom to one that numerous teachers described as a "desk job," "chained to a computer." That transformation did not end for most teachers when schools sought to re-open in fall 2020, and more than half (61%) reported in March 2021 a diminished sense of success as a teacher.

The unique challenges of hybrid models

With the onset of the 2020–2021 school year, and with the pandemic not yet abated, teachers found themselves in one of several teaching modalities: still teaching remotely; teaching both remotely and virtually at different times; teaching remotely and virtually at the same time; or, in a relatively few cases, teaching entirely in person (Bartlett, 2022; Kraft, 2021). At the time of the November 2020 teacher survey (N = 73), nearly two-thirds (63%) of SDRP teachers reported working fully remotely, and more than one-

quarter (26%) were teaching in some hybrid configuration. Those required to teach both in-person and remote students simultaneously experienced the highest demands and voiced the greatest fatigue and frustration (see also Kraft et al., 2021).

By March of 2021 only about one-third of teachers were still fully remote (31%) and nearly half (47%) were teaching in some form of hybrid arrangement. Yet few teachers at that point—a year after the shutdown—reported that they could use most or all of their preferred instructional methods; student engagement remained a significant challenge for 80% of SDRP teachers and 78% were especially concerned about their most vulnerable students. By November of 2021, instructional configurations had shifted dramatically, with 88% of teachers teaching in person, a figure that corresponds to findings of a large-scale survey of teachers in 14 states (Conklin and Kraft, 2022). Three-quarters of SDRP teachers reported that they were able to use most or all of their preferred methods, although almost half (47%) still found student engagement to be a significant challenge and more than half (53%) still expressed concern about meeting the needs of their most vulnerable students. An interview- and observation-based case study of teachers in four high schools similarly found that hybrid configurations placed heavy burdens on teachers, with more than 80% rating student engagement a significant challenge under pandemic conditions (Jabbar et al., 2021).

Context mattered

The broad patterns outlined above mask significant contextual variations that shaped teachers' curricular decisions, instructional strategies, and interactions with students. Technology access and expertise varied at the teacher, student, and system levels. Teachers and students in rural areas were especially hampered by limited access to technology; veteran teachers faced a steeper learning curve and often turned to younger colleagues for help. Teachers in more affluent and predominantly white communities were more likely to secure student participation and engagement, while teachers in more diverse and low-income communities struggled to maintain contact with students and families and to supply adequate instructional support. Teachers of special needs students and English Language Learners similarly found sustained contact and support difficult. Teachers of young children found themselves dependent on parent support to engage the children in academic activity.

In contrast, secondary teachers contended with students caring for younger siblings, working a job, seeking instructional help at odd hours, or electing not to show up at all. Finally, teachers' instructional guidance, support, and leadership varied from local schools and districts. These same contextual variations surface in a range of survey-based and interview studies (Balfe et al., 2020; Hamilton et al., 2020; Jabbar et al., 2021; Kraft and Simon, 2020; Kraft et al., 2020, 2021; Reich et al., 2020). Throughout the various transitions, teachers with favorable working conditions and strong relationships with colleagues felt better able to manage the instructional challenges posed by teaching in a pandemic.

Teachers' relational work

Relationships are the heart of teaching (Hargreaves, 2001; Lortie, 1975; Nieto, 2003; Kim et al., 2021). Teachers' relationships with their students and their colleagues have been strongly linked to their resilience and wellbeing, and to feelings of professional fulfillment and success (Gu, 2014; Kelchtermans, 2017; Le Cornu, 2013). Until March 2020, teachers' relationships were typically forged and nurtured within the context of brick-and-mortar buildings. However, the disruption of in-person teaching profoundly affected these relationships in at least three ways. First, students' attendance and engagement with school plummeted and teachers found themselves missing their students and their classroom rituals. Second, the boundaries between home and school became blurry, with parents, especially those who shifted to working from home, getting front row access to their child's learning and teacher. Finally, pandemic teaching brought with it a number of unprecedented constraints (e.g., teaching from home in spring 2020 and social distancing and masking if teaching in person in 2020–2021) isolating teachers from their colleagues.

Students: disrupted participation, disrupted relationships

Student participation dropped precipitously in the spring of 2020 with 82% of SDRP teachers reporting a loss of student presence. The drop was attributed to insufficient technology infrastructure and challenges navigating the technology needed to access school for elementary teachers. For secondary teachers, it was fundamentally related to student absences, as many school districts eliminated attendance requirements and passed policies prohibiting failing grades (Bartlett et al., 2020). A high school science teacher in Massachusetts shared his struggles to stay connected with students,

Even that first quarter that ended the beginning of April [2020], I think, and to give you the harsh truth, I lost most of my kids. In the very beginning I heard from maybe 15% of them. I have 150 students. Then it went to 10%. And then I was literally just begging them to answer my messages and tell me that they and their families were OK.

Student engagement continued to be a challenge during the academic year 2020–2021. Teachers who taught online struggled to engage students who joined class with their audio muted and their cameras off. Teachers who taught in person had masked students in their classrooms and social distancing measures inhibiting movement. In a November 2020 survey, 75% of SDRP teachers cited

student engagement as a major challenge while also indicating their greatest source of satisfaction arose from their personal connections with students. Several studies (Kim et al., 2021; Niemi and Kousa, 2020; Reich et al., 2020; Tackie, 2022; Woltran et al., 2021), detailed the negative implications of this relational loss. In England, the importance of relationships with students emerged as a prominent theme in an interview-based study of 24 primary and secondary teachers from 20 schools: "In stories about teacher-pupil relationships, teachers expressed sadness and frustration about lack of contact with the pupils but seemed to feel a real sense of joy when they were in touch" (Kim et al., 2021, p. 252).

SDRP teachers acutely felt the loss of their daily, non-academic, interactions with students emphasizing the inherently relational nature of teaching. In referring to missing her students, one middle school teacher in Texas (T25 Aug. 5, 2020) expressed that "the reason I like my job is gone." The loss of student participation and engagement flattened relationships and pared down classrooms to spaces of content delivery, not the vibrant interactive environments that bring teachers pleasure in their work. Drawing from Noddings' (2013) concept of confirmation in relational care, Jones and Kessler (2020) discuss how changes to teacher student relationships from COVID conditions challenged teachers' identities and how they saw themselves as teachers. Indeed, SDRP teachers reported declines in feelings of efficacy as a teacher and increases in indicators of burnout, including increased cynicism and a decreased capacity to support others.

Families: support, scrutiny, and changing perceptions

Teacher-parent/caregiver relationships were also affected. The widespread shift to online schooling brought the work of teaching into homes like never before. In spring 2020, teachers, particularly elementary school teachers, provided parents with emotional and technological support. One SDRP elementary teacher (T24 Aug. 11, 2020) shared that half of her job involved supporting parents, showing them how to use Google Classroom and Zoom. An elementary teacher recalled her efforts to soothe parents, "I can't tell you how many parents I had to Zoom with or call just to talk them off the ledge because the stress level was just incredible." Recognizing that many parents were balancing their work demands and the home-based schooling of their young children, teachers made themselves available outside typical school hours. For example, a Kentucky elementary school teacher would take parent calls at 10 p.m. to accommodate work schedules.

Teachers spoke of parents' appreciation of their work and many felt that parents recognized their efforts and effectiveness. A Florida elementary school teacher expressed, "In the spring (2020) teachers were perceived as being miracle workers. We turned around on a dime and, you know, took our teaching remote and did the best we could with it." She experienced this appreciation, however, as short lived. Amid debates about fall 2020 returns to school, this teacher felt parental sentiment shifting, "And now I think teachers are being seen a little bit as the bad guy when they question the safety and whether or not they want to go into the classroom with kids in this situation ... they (parents) are not going to remember that they thought we (teachers) were heroes in the spring." Teachers felt demoralized by this noticeable shift in parents' perceptions. For example, an elementary school teacher in Massachusetts felt discouraged by the name calling from parents "I find it kind of discouraging because to look on social media ... as there is a lot of anger toward teachers and it's not simply parents saying, you know, 'I'm in a bind.' It's some really nasty name calling." Another elementary school teacher in Texas was upset to see that teachers' work merely involved looking after children while parents went to work "But I don't think that is the main point of our work. And so that's been. I think (it's) hard for me to just happen to be hearing a lot of that (parents saying teachers should go back to in person schooling) and seeing a lot of that."

Other studies have also indicated that teacher-parent relationships were affected by the pandemic. For example, in Norway, Bubb and Jones (2020), and in the UK, Kim et al. (2021) found that parents, especially those of young children, were very appreciative of teachers' support in spring 2020. In contrast, in Canada, the Alberta Teachers Association reported teachers feeling discouraged by parental frustration directed at them (Alberta Teachers Association, 2020; see also Fontenelle-Tereshchuk, 2021). Although additional research is needed to further understand whether the schools reopening discourse was as polarized in some countries as in the US, early reports from Canada and the UK (see Hargreaves, 2021; Marchant et al., 2021) suggest school reopening in fall 2020 was a subject of heated debate that caused schisms in some communities.

Colleagues: an important source of support

During school closures and throughout the 2020–2021 school year, teachers in the SDRP sample turned to other teachers for instructional and emotional support. More than two-thirds of the focal teachers interviewed relied on existing relationships in their own schools ("a very collaborative team," "good grade level teams," "a strong community of teachers"). Without a blueprint for pandemic teaching, teachers supported each other in multiple ways. They collaboratively learned and introduced each other to new technology, shared resources, planned lessons together, divided the workload, and helped one another reach out to students and families.

Those who collaborated closely with school-based colleagues credited that experience with easing their own stress and creating a more coordinated experience for students. A fifth grade teacher recalled the early days of the shutdown:

We kind of jumped into our own challenges and were each hosting our own lessons for our own classes. And then after three weeks, we were completely overwhelmed, and we got together and decided to collaborate. And it went a lot smoother after that.

Although teachers described technical and instructional support in some detail, they also highlighted the significant social and emotional support they enjoyed from colleagues. A high school teacher reported that “a lot of us have really banded together and have been some pretty strong emotional support for each other, so that’s been very powerful We were kind of being therapists for each other.”

Some teachers acknowledged stark contrasts between strongly or weakly collaborative contexts. An elementary teacher who has “always had really collaborative relationships” expressed gratitude for those relationships in part because “I talk to colleagues around the district ... who are not a part of collaborative teams, and they’re sinking, I mean, they’re just drowning.” Another speculated on the likely importance of the pre-pandemic school workplace culture:

I suppose if you were working well as a team before, then you are going to continue to work well as a team with Covid. ... If you were dysfunctional prior to Covid, you’re going to be even more dysfunctional now.

The experience of the SDRP teachers mirrors that of teachers in other studies. [Jabbar et al. \(2021\)](#), in an ongoing study of teacher retention, found teachers’ collegial interactions varied. Although teachers in that study also reported some crucial support from their colleagues, 61% reported that the pandemic had a negative effect on collaboration and collegial support. Distance deprived them of informal conversations and created a barrier to co-planning. [Johnson \(2020\)](#) explored the experience of teachers and administrators in one high-poverty district following the shutdown, with findings that underscore the importance of workplace culture and social organization. She writes:

In schools where teachers were accustomed to collaborating regularly on well-established teams, they swiftly moved their meetings online and continued to deliberate together as they made difficult decisions based on their best collective knowledge and judgment. ... By contrast, in compartmentalized schools, where professional norms of self-reliance and autonomy prevailed, teachers were on their own and students often paid the price (p. 2).

The teachers in SDRP, like participants in other studies, reaffirmed that despite the disruptions brought by distance learning, relationships remained the heart of teachers’ work.

Looking ahead: implications for teachers and teaching

In 2021, the United Nations named teachers the “driving force behind global education recovery from COVID-19” ([United Nations, 2021](#)). This calls upon educational policymakers, scholars, and all involved in educational change to reconsider what it means to support teachers’ work. The pandemic highlighted, as crises tend to do, the core satisfactions and stressors of the work. It also disrupted, albeit briefly, a narrow and technocratic framing of accountability as it related to teachers’ work. This moment has the potential to be a focusing event ([Birkland, 1998](#)), as it could provide the impetus and insight needed to rethink the structure and support of teachers’ work.

Experiences amid the COVID-19 pandemic underscore the extent to which teachers’ sense of success derives from daily interactions with students, discretion over instructional practice, and influence on their working conditions. Teachers struggled to find energy and stay optimistic when intrinsic rewards of teaching were disrupted: student relationships, community connections, and collegial collaboration. Their sense of efficacy was eroded when compelled by schooling modifications to develop practices contrary to their pedagogical philosophy. Foregrounding these priorities, they used inventive strategies to remain connected to students from a distance and contested learning configurations designed without their input.

In the spring of 2020, emergency conditions led many places to abandon a narrowly defined and externally managed version of accountability. Instead, school and community leaders asked teachers to use their professional knowledge and experience to customize educational programs to local circumstances. Teachers looked to one another to build capacity for the technical and pedagogical shifts needed to meet the moment. New professional knowledge networks emerged and established ones deepened as teachers determined student needs and developed tools for teaching and learning. Bureaucratic conceptions of accountability were replaced with a more broadly defined accountability rooted in the profession itself: one that required and drew on teachers’ professional expertise. This disruption to the narrow conception of teacher accountability was short-lived as fall 2020 efforts to resume schooling norms also reasserted technocratic control of teachers’ work.

A longer view of teachers’ work sheds light on how teachers’ experiences during the pandemic fits into broader patterns. If four decades ago marked the beginning of the “age of market forces and managerialism” in schooling that reshaped the “pattern and texture of [teacher work] intensification—the nature of the tasks that are absorbing increased quantities of teacher time and emotional labor” ([Gewirtz, 1997](#)), then the COVID-19 pandemic arrived at a time when these pressures were coalescing on the teacher workforce. Scholarship has documented a rise in teacher burnout during the 21st century tied to the technocratic accountability movement ([Dworkin, 2014, 2009](#); [Ryan et al., 2017](#)) and demonstrated that teacher shortages have worsened with particular

consequences for high-poverty schools (García and Weiss, 2019). Thus, teachers' reported discontent with the relational aspects that ground their work in conjunction with their experience of work intensification during the pandemic should compel attention.

Research is considering the pandemic's longer-term implications for teachers' work. One debate centers on educator recruitment and retention. Some reports identify growing dissatisfaction among teachers as an indication of a looming shortage (Walker, 2022), while others counter that longitudinal teacher attrition data do not support these claims (Goldhaber and Theobald, 2022). However, just as working hours alone are not an adequate measure of work intensification, attrition rates are just one of a range of effects on the teacher workforce. Teachers' experiences during the COVID-19 pandemic raise key concerns related to educator wellbeing, sense of success, and experience of burnout. Moreover, if educators' wellbeing is intimately tied to student wellbeing, then "we cannot serve our students by sacrificing our teachers" (Hargreaves, 2021, p. 1852).

The pandemic could be the impetus to shift policy accountability orientations toward teachers' work from one of tight control to one of increased voice and autonomy. Indeed, teachers themselves have led efforts to influence, reinterpret, and contest policies and to demand quality teaching and learning conditions throughout the pandemic. It remains to be seen which shifts related to teachers' work will be fleeting and which will lead to enduring change—and which direction change may take.

Psychology is a science, and teaching is an art; and sciences never generate arts directly out of themselves. An intermediary inventive mind must make the application, by using its originality.

James (1899, p. 14).

Introduction

In a chapter from 1984, republished as a journal article in 1988, the British curriculum scholar Lawrence Stenhouse wrote a sentence which, in hindsight, can only be characterized as visionary. It reads as follows: “Improving education is not about improving teaching as a delivery system [because] crucial is the desire of the artist to improve his or her art” (Stenhouse, 1988, p. 50). The sentence is visionary, because if there is one thing that has characterized educational policy, research, and practice over the past decades, it is precisely the ongoing effort to steer the whole educational enterprise toward becoming an effective delivery system of measurable learning outcomes (see, e.g. Ball, 2012). In this set up the teacher is identified as an important *factor*—there are numerous documents in which it is claimed that research has shown that the teacher is the most important “in school factor” in the production of measurable learning outcomes (see, e.g. King-Rice, 2003; OECD, 2005; McKinsey and Co., 2007)—but not as a thinking, judging and acting professional who is driven by an ongoing desire to improve his or her own “artistry” (I will return to this term below).

The key word in these developments is the notion of “effectiveness,” and the “double move” that has taken place in many countries over the past decades has been to make the operation of the education system more effective and to do so with regard to the production of an increasingly smaller number of measurable “learning outcomes” (see Biesta, 2010; Sellar et al., 2017; Hogan and Thompson, 2021). This line of thought has brought about a world-wide educational evidence “industry” that seeks to find out, through the conduct of large-scale experimental studies, what allegedly “works” in education. Moreover, the ambition of such research is to tell teachers what they should do in order to impact effectively on the production of particular “outcomes.” Some claim that the “extraordinary advances in medicine, agriculture and other fields” are the result of “the acceptance by practitioners of evidence as the basis for practice,” particularly evidence from the randomized controlled trial, and that it is about time that education embarks upon a similar path (see Slavin, 2002, p. 16). Others, however, have raised fundamental questions about this approach, asking both whether this is a *desirable* way forward for education, and whether it is even a *possible* way forward (see Thomas, 2021; see also; Biesta, 2015; D’Agnese, 2017; Davis, 2017; for an illuminating conversation see Hattie and Nepper Larsen, 2020; and for a critique from within the medical field see Holmes et al., 2006).

The question about the *possibility* of this vision has to do with how we envisage the dynamics of education. In the view of education as a delivery system, teaching is seen as an “intervention” which, under “ideal” circumstances, will bring about particular “outcomes.” We can characterize this as a causal conception of education in which teaching is seen as a cause and learning—or in the lingo of this approach: “learning outcomes”—as the effect of teaching interventions. In this set up the teacher does indeed appear as a factor in a production-line, and one could say that the only possible role for the teacher here is that of a *technician*, that is, the one who administers prescribed interventions. The question this line of thought raises is whether this is an adequate and accurate understanding of the dynamics of education and in what is to follow I will argue that this is *not* the case. Yet this also has to do with the question of the *desirability* of this vision. With regard to education itself, the question is whether we should indeed see education as a matter of control, that is, a matter of administering interventions which, under “ideal” circumstances, will bring about predetermined outcomes. This, in my view, is a problematic and impoverished conception of what education is and should be about. In addition to this, there is also the question of the desirability of the “figure” of the teacher that is entailed in this vision, that is, of the idea of the teacher as “factor” or technician who both is controlling his or her students and is being controlled by the prescriptions based on the alleged evidence about what does and what doesn’t “work.” Again, as I will argue, such a conception of the teacher amounts to a misrepresentation of the complex work of teaching and therefore doesn’t speak to what this work is about and what is at stake in it.

In several of my publications I have raised questions about the adequacy of a mechanistic or “quasi-causal” conception of education in which teaching is seen as an intervention, the teacher as a factor, and the focus is on increasing the effectiveness of teaching interventions for the production of learning outcomes. Instead, I have made a case for complexity, that is, for seeing education as an open, semiotic, and recursive system, that is, a system “populated” by thoughtful individuals who can make up their own mind and can act accordingly, and whose interaction is a matter of communication and interpretation, not of mechanical “push and pull” (see, for example, [Biesta, 2016](#)).

In this contribution I wish to focus on one particular aspect of this discussion, namely the suggestion that we should understand teaching and the work of the teacher as an *art*, first and foremost in the Aristotelian sense in which the arts are about human activity in the domain of the “variable.” Work in this domain requires “artistry”—the ability to make situated judgments about what are desirable ways of acting, which always entails judgment about the “how” and about the “what for.” In this regard, as I will suggest below, teaching can be characterized as a “double art.” In the three main sections of this chapter, I will discuss the question what teaching is, which, inevitably, has to engage with the question what teaching is *for*. I will then turn to Aristotle in order to look in more detail at the complexities of work in the domain of the variable. In a third step I will discuss ideas from Lawrence Stenhouse, being one of the authors who has made an explicit case for teaching as an art and for the artistry of teaching. I do this in order to show that a claim for the artistry of teaching does not have to start from scratch but can build upon ideas that may have been forgotten and definitely have become marginal in the educational conversation. Another author who has made significant contributions to the “case” for seeing teaching as an art and for focusing on the artistry of teaching is Eliot Eisner (see, e.g. [Eisner, 2002](#)). One reason for focusing on the work of Stenhouse rather than Eisner is that Eisner’s contribution stays more closely to the Aristotelian line of argument presented in this chapter, whereas Stenhouse, in a sense, locates the artistry of teaching closer to the (performing) arts. In the concluding section I will say a few words about the intellectual and political work needed for reclaiming a meaningful account of teaching.

The point and purpose of teaching

I wish to take my starting point in the observation that teaching is a relational, intentional, and purposeful activity (for a detailed discussion see [Biesta and Stengel, 2016](#)). Firstly, teaching is not something one can do on one’s own but implies a relationship between teachers and (their) students, which means that it takes at least two for teaching to take place. Secondly, teaching doesn’t happen by accident; those who teach, or try to teach, do so deliberately. And thirdly, teaching is done with a sense of purpose, which means that it is done for a reason. Teachers have, in other words, good reasons for what they teach and how they teach, and these reasons have something to do with what they hope that their activities will bring about on the side of their students, albeit that it remains open whether or not this will happen as the “success” of teaching is not just reliant on what teachers do but also one what students do with what they are being taught.

Over the past decades, the prevalent answer to the question what teaching is *for*, has become “learning.” This, however, is a rather impoverished idea of what teaching should aim for and actually also a rather unhelpful suggestion. This is not just because learning can happen anywhere, also without teaching. It is also because learning can go in any direction, and therefore just to say that teaching should bring about learning or that the work of teachers is to “facilitate” learning, says very little, if it says anything at all. The point of education rather is that students learning *something*, that they learn it *for a reason*, and that they learn it *from someone*. Education, in other words, is never about learning in general but always raises questions of content, purpose and relationships. And it is here that teaching comes in, because whereas students can learn all kind of things from being in educational settings—including how to cheat or how to pass an exam with minimal effort—the work of the teacher is to direct the attention of students to particular subject-matter, particular themes, particular issues, and particular tasks and, most importantly, to do so with particular reasons and purposes in mind. Teaching, in other words, is always conducted with an orientation.

Elsewhere (see for example [Biesta, 2009, 2010, 2020](#)) I have suggested that there are actually three purposes (or as I prefer: domains of purpose) that are always at stake when education takes place. One important reason why we engage in education is to make knowledge and skills available to our students. We can refer to this as knowledge acquisition, but it is perhaps better to say that one important purpose of education is *qualification*, that is, providing students with knowledge, skills, attitudes, and dispositions that makes it possible for them to do something. This “doing” can either be quite specific and precise, such as becoming qualified for a particular job or profession; but it can also be understood more broadly, such as the way in which schools seek to equip children and young people for their life in complex modern societies.

Some argue that qualification is the sole purpose of education because they are worried that anything else gets education into difficult normative questions, and these are better left to the family or community context. This may sound reasonable, but the problem is that since education is unable to provide children and young people with all existing knowledge and skills, there is inevitable selection going on in education. In everything we do we thus present our students with a particular “selection” of the world or, more positively formulated, with a particular *representation* of the world. The ways in which we do this inevitably influence our students in some way. Normative questions are therefore inescapable, even if education were confined to the domain of knowledge and skills.

In the literature the (re)presentation of the world, or the presentation of different representations of the world, is known as *socialization*. Some highlight the ways in which this goes on behind the backs of our students—an idea known as the hidden curriculum. Yet we can also think more positively about this and see socialization as an important second purpose of education, where we try to

provide our students with an orientation in the world, that is, with a sense of direction. Education as socialization is about providing our students with an orientation into existing cultures, traditions, and practices, with the invitation that they locate themselves within them.

Discussions about socialization, particularly strong(er) and (more) directive approaches, raise an important further question, which has been part of the modern educational conversation at least since the Enlightenment. The question here is whether education can and should approach students as “objects” that need to be (come) qualified and socialized—which seems to be the dominant “undertone” of the idea of teaching as a delivery system—or whether education always needs to ensure that children and young people can become subjects of their own life. This is partly a very complicated and deeply philosophical question, but it is also a very simple issue which many educators will immediately recognize. After all, in all education we want to make sure that students stop relying on our help and input and become able to think for themselves, make their own judgments, and be able to act and act *well*.

There are different ways in which we can refer to this third domain of educational purpose. I tend to refer to it with the word “*subjectification*,” which is perhaps a rather odd word in English, but precisely refers to the ambition that students end up as subjects of their own life and not just as objects of educational “interventions.” It therefore stands in sharp contrast to education that aims for objectification, that is, education which is only interested in controlling students and their acting, thinking and judgment. Of course, we cannot force our students to be subjects of their own life, but we can, in all kinds of ways, “remind” our students of this possibility to exist as subject of their own life. And we can provide them with opportunities to encounter and experiment with the complexities of what this means (see [Biesta, 2020](#) for more detail).

Dietrich Benner has suggested the phrase “*Aufforderung zur Selbsttätigkeit*” as a way to capture the special character of educational work in this domain (see [Benner, 2015](#)). This can be translated as “summoning to self-action,” although the “summoning” may sound a bit strict and a word like “encouragement” might be more helpful. This should not be understood as the encouragement to be yourself, and also not the encouragement just to become active. It is perhaps best to see this as the injunction to be a self, that is, to try to be a subject of your own life, with all the complexities and responsibilities that follow from it, rather than remain an object of influences from “elsewhere.”

Another set of concepts that is helpful here is Benner’s distinction between affirmative and non-affirmative education (see [Benner, 2015](#), pp. 146–155). Whereas qualification and socialization are, to a large degree, affirmative, in that they start from certain ideas about what education should achieve and where children and young people should end up, the domain of subjectification is precisely the opposite of this, because here it is not for educators to tell children and young people how they should be and become, but rather to provide opportunities for them to figure out for themselves how to live their own lives in the best way possible. That is why the educational work vis-à-vis this domain has to be non-affirmative and has to proceed with caution.

I wish to suggest that qualification, socialization, and subjectification are not only three *legitimate* purposes of education; in a sense they are also three *inevitable* purposes of all education. After all, in all instances of education there is always something for teachers to offer to students and for students to acquire to their benefit. Because qualification always represents (aspects of) the world in a particular way, there is always also socialization going on. And all this also has an impact on the student as subject, to begin with because becoming more knowledgeable or skilled (qualification) and gaining orientation in a particular domain or field (socialization) provides students with increased possibilities for thinking, judgment, and action.

The fact that these three domains of purpose are inevitable, first of all suggests that the three domains are always entangled with each other; they cannot exist separately, because every act of qualification is also an act of socialization and also impacts on the student’s subject-ness, positively or negatively. It suggests, secondly that in the design and enactment of education teachers should always consider what they seek to achieve—or what they seek their students to achieve—in relation to each of these domains. Thirdly, although the three domains are always “in play” in education, it doesn’t mean that they can exist in perfect harmony. There are always potential tensions between, say, what one seeks to achieve in the domain of qualification and what is possible in the other domains. There can be synergy—understanding subject-matter well also provides a degree of orientation and contributes to one’s agency—but there can also be conflicts—for example when a too strong push on the domain of qualification undermines students’ agency.

The challenge for teachers, therefore, is not just to think and act in a three-dimensional way, that is, with an eye on the three domains of educational purpose. The challenge is also to try to secure a meaningful balance and think carefully about the costs of emphasizing one domain to the detriment of the other domains. This, as I will argue in the next section, is one important reason why teaching needs to be understood as an art and why teachers need artistry rather than techniques or prescriptions.

The double art of teaching: craft and wisdom

One key message emerging from the discussion so far, is that teaching cannot and should not be enacted as a form of control or, to be more precise, as a kind of intervention that, under “ideal” circumstances and based upon the best “evidence” about what “works,” should be aimed at producing pre-specified learning outcomes. This is not to suggest that everything should be open, which is the mistake of those who denounce teaching in favor of learning. But it is to challenge the view that education is ultimately a causal system (an ontological claim) and that, once we have perfect knowledge about the mechanics of the system (an epistemological claim), teaching can become a matter of administering those interventions that produce the desired outcomes

(a praxeological claim). The whole point of teaching is precisely *not* the production of outcomes but a matter of educating human beings so that they become more qualified, that is, able to act thoughtfully, gain a sense of direction in the world, and, through this, take upon themselves the challenge of being subjects of their own lives.

If this is not a matter of implementing evidence-based intervention, how then should we understand the work of teachers, and what do they need to act thoughtfully in educational settings? These questions relate back to a rather old discussion which has been framed, correctly in my view, as the question whether teaching should be understood as a “science” or as an “art.” This question surfaces regularly in the educational conversation, including in the quote with which I opened this article. In my view, the most helpful engagement with this question can be found in the work of Aristotle, for whom the difference between “science” and “art” is not a matter of different kinds of knowledge but actually begins with a proper understanding of the reality we are acting “in” and “upon” in such practical endeavors as education.

With regard to this Aristotle makes a very helpful and, in my view, tremendously important distinction between the theoretical life (the “*bios theoretikos*”) and the practical life (the “*bios praktikos*”). The theoretical life is concerned with “the necessary and the eternal” (Aristotle, 1980, p. 140), that is, with those aspects of reality that do not change (Aristotle mentions such phenomena as the movement of the planets or the stars in the sky). He refers to knowledge about this reality as “*episteme*,” which is often translated as “science.” “*Episteme*” is knowledge about what is necessary and eternal and because the reality that this knowledge is about doesn’t change, the knowledge we have about this reality, once it is accurate, will not change either. From this we have an idea of true knowledge as being 100% stable, secure, and certain.

Aristotle’s main insight, however, is that most of what our lives are about takes place in the domain of the “variable” (for this term see Aristotle, 1980, p. 42), that is, the domain of change. It is the world in which we act and where our actions have consequences, but where there is no guarantee that our actions will always have the same consequences. It is, in other words, the domain of possibility, not the domain of certainty. Knowledge in this domain is about the relationships between our actions and the *possible* consequences of our actions. This is so for our actions in and interactions with the material world, our actions in and interactions with the living world, and our actions in and interactions with the social world. While we can gain much knowledge about possible relationships between actions and consequences in these domains, there is never a guarantee that when we act in the same way in the future, the same consequences will follow. And precisely there lies the difference between “science” and “art,” where art refers to our actions in the domain of the variable.

What is also interesting about Aristotle’s explorations is that he makes a further distinction between two “modes” of acting in the domain of the variable and two related forms of judgment. This is the distinction between *poiesis*, which Carr (1987) has helpfully translated as “making action,” and *praxis*, which Carr translates as “doing action.” *Poiesis* is the art of making things—such as, for example, a saddle or a ship—although I prefer to think of it slightly more widely, that is, as action that brings something into existence. We might also call it “productive action.” As Aristotle puts it, *poiesis* is about “how something may come into being which is capable of either being or not being” (which means that it is about the variable, not about what is eternal and necessary), and about things “whose origin is in the maker and not in the thing made” (which distinguishes *poiesis* from biological phenomena such as growth and development) (see Aristotle, 1980, p. 141). *Poiesis* is, in short, about bringing something in existence that did not exist before.

The kind of knowledge we need for *poiesis* is what Aristotle refers to as *techne*, which he defines as “knowledge of how to make things” (Aristotle, 1980, p. 141). *Techne* is about finding the means that will bring about what one seeks to bring about, to put it in general terms. *Techne* encompasses knowledge about the materials we work with—and we can take “materials” in the broad sense of the word—and about the techniques we can apply to work with those materials. Yet making something, such as a saddle, is never simply about following a recipe. It involves making judgments about the application of our previous knowledge and experience to *this* piece of leather, for a saddle to fit *this* particular horse, and for *this* particular person riding the horse. So we make judgments about application, production, and effectiveness in our attempts to bring something into existence. The best English word for *techne* is probably craftsmanship although in a slightly narrower translation we can also think of it as consisting of the combination of practical knowledge and practical judgment.

The domain of the variable is, however, not confined to the world of things and matters of making, but includes the social domain, that is, the world of human action and interaction. It is here that a second art is called for: the art of *praxis*. The orientation here is not toward the making of things but toward the promotion of the human good (the Greek term is *eudamonia*). *Praxis*, Aristotle writes, is “about what sort of things conduce to the good life in general” (Aristotle, 1980, p. 142). What we need in order to proceed here is not judgment about how to do things, but rather judgment “about what is to be done” (Aristotle, 1980). Aristotle refers to this kind of judgment as *phronesis*, which is usually translated as practical wisdom. Aristotle defines it as a “reasoned and true state of capacity to act with regard to human goods” (Aristotle, 1980, p. 143).

Aristotle thus provides a powerful argument for the idea that teaching is an art and not a science and also provides us with precise definitions of “art” and “science.” The key insight here is that teaching takes place in the domain of the variable, that is, the domain of actions and possible consequences, and the reason for this, to put it bluntly, is that in teaching we work with “living material,” that is, with human beings who are capable of their own thought and action. What is also interesting about Aristotle’s approach, is the distinction he makes between two different arts: the art of making, for which we need *techne*, which is the practical knowledge and practical judgment about how to bring something into existence, and the art of doing, for which we need *phronesis*, the practical wisdom we need to judge what is to be done. In this regard we could say that teaching is a “double art,” which requires both educational craftsmanship—the “*techne*” of teaching—and educational wisdom—the orientation of what teaching is *for*.

The final point to make here is that the “how” of teaching and the “what for” of teaching should not be seen as disconnected from each other. It is not that in education we can first set the goals and then just find the most effective and efficient way of getting there. The reason for this lies in the simple fact that the ways in which we proceed in education, the ways we teach, the ways we engage with our students, the ways we focus their attention, the ways we encourage them, are not just more or less effective interventions that happen behind the backs of our students. On the contrary, they are in full view of our students, and contain important messages for our students as well. This means that in addition to judgments about the purposes of our teaching, judgments about the way we try to balance the different domains of purpose, and judgments about possible trade offs in achieving a balance, we also need to judge the ways in which we teach. And this judgment is not just technical—which is the question of effectiveness—and also not just moral—“Are the ways in which we teach morally acceptable?”—but also needs to be *educational*, that is, to be judged in terms of the ways in which they may or may not contribute to the overall ambitions we have with our teaching.

If teaching is an art and, more specifically a “double art” of craft and wisdom, then it is important that teachers keep working on their own educational “artistry,” that is, their ability to make situated judgments about educationally desirable ways of acting in the always new situations they encounter. It is here that the whole question of the ongoing improvement of education finds its “home,” so to speak, because, to quote Lawrence Stenhouse once more, “improving education is not about improving teaching as a delivery system [because] crucial is the desire of the artist to improve his or her art” (Stenhouse, 1988, p. 50). And I wish to reiterate that to think of teaching as an art in the nuanced way in which I have discussed it in this section, provides a way to distinguish it from technicist accounts that seek to do away with the need for complex educational judgment and ongoing inventiveness in the educational situation.

Lawrence Stenhouse on the artistry of teaching

I have given this chapter the title “*reclaiming the artistry of teaching*” because I wish to highlight that the insight that teaching is an art (in the Aristotelian sense of the word) which requires artistry from its artisans, so to speak, is not a new insight. It partly goes back to the very origins of Western philosophy and, more specifically, to the work of Aristotle who, unlike Plato, can be seen as one of the first philosophers within the Western “canon” who had a keen interest in the practical life of change and possibility. The particular connection with the practice of teaching is also not new, and can, in a sense, be seen as an important “thread” in modern educational thought. Think, for example, of the idea of “tact” in the work of Herbart (for an excellent discussion see Van Manen, 1995; see also Van Manen, 1991), William James’s comments on the art of teaching quoted at the beginning of this chapter, or the work of Joseph Schwab on the idea of “the practical” (e.g. Schwab, 1991; see also Reid, 1999 on the “deliberative tradition”). We could even say that modern educational thought and practice are characterized by an ongoing tension between those who seek to push teaching toward the technicist end of the spectrum and those who make the case for teaching as thoughtful inventive situated action. One author whose work is clearly positioned within the latter approach and who not just has made the case for seeing teaching as an art but also has connected this explicitly to the idea of “artistry” is, as mentioned, Lawrence Stenhouse. In this section I wish to take a closer look at some of their ideas.

Lawrence Stenhouse locates the discussion about the artistry of teaching in the context of questions about “the relation of research to educational action” (Stenhouse, 1988, p. 43). Acknowledging that the contribution from disciplines such as history, philosophy, psychology, and sociology provide “a context in which to plan intelligent action” but that such disciplines “do not tell us how to act” (Stenhouse, 1988), he notes that “the yearning toward a form of research which might guide educational action [has] led educational researchers to look enviously at agricultural research” (Stenhouse, 1988). Such research is characterized by “field trials which [utilize] random sampling ... in order to recommend to farmers those strains of seed and crop treatments which would maximize yield” (Stenhouse, 1988). Stenhouse argues, however, that this approach—which nowadays is more commonly referred to in education as the “medical model”—is not appropriate for the field of education, both because of the idea of “random sampling” and because of the talk about “yield.” Not only does he make the interesting point that “it is the teacher’s job to work like a gardener rather than a farmer, differentiating the treatment of each subject and each learner as the gardener does each flower bed and each plant” (Stenhouse, 1988, p. 44). He also highlights that “the variability of educational situations is grossly underestimated” in the agricultural approach, which means that “sampling procedures cannot be related to educational action except on a survey basis rather than an experimental basis” (Stenhouse, 1988), and he points out that the intentionality of educational action is not a matter of having a goal that should be “produced,” but that “purpose in education is having an agenda” (Stenhouse, 1988).

Stenhouse also rejects the suggestion that for teachers to know what to do should be a matter of following instructions “laid down for us in the form of curricula and specifications of teaching methods” (Stenhouse, 1988). This is partly because of the totalitarian character of such a suggestion which, in his view, goes against the very point of education as “learning in the context of a search for truth” (Stenhouse, 1988). It is not only that “truth cannot be defined by the state even through democratic processes,” and if the state were to do this it would be as problematic as “the totalitarian control of art” (Stenhouse, 1988). Stenhouse also argues—and the point is entirely correct in my view—that teaching requires “situational professional judgment” because “prescriptions will vary according to cases” (Stenhouse, 1988). “We do not need doctors if all they are going to give us is a treatment laid down by the state or suggested by their professor without bothering to examine us and make a diagnosis” (Stenhouse, 1988).

For Stenhouse, then, the key argument against attempts to control teaching, either by state mandates or through particular forms of research that are supposedly able to tell teachers “what works,” lies in the simple statement that “good teaching is created by good teachers” (Stenhouse, 1988, p. 45). Stenhouse acknowledges that this statement may seem “self-evident to the point of absurdity” (Stenhouse, 1988), yet he also stresses that “the implications of this self-evident proposition do not seem to be widely grasped” (Stenhouse, 1988)—to which I wish to add that they are *still* not widely grasped, given the ongoing desire by many policy-makers, politicians, and others, including educational practitioners, to push the field of education and the work of teachers toward technicism. All this doesn’t mean that teachers should not welcome “access to ideas created by other people at other places or in other times,” but they do know—and so should those who generate such ideas—that all this is “not of much real use until [it is] digested to the point where [it is] subject to the teacher’s own judgment” (Stenhouse, 1988). And this is so because education cannot be done “behind the back” of teachers. As Stenhouse puts it: “only teachers are in the position to create good teaching” (Stenhouse, 1988).

It is at this point that Stenhouse brings forward the claim of teaching as art, and art as “an exercise of skill expressive of meaning” (Stenhouse, 1988). He explains: “The painter, the poet, the musician, the actor and the dancer all express meaning through skill.” Some are geniuses, but claiming teaching as art is not meant to elevate teachers inordinately, but rather to diagnose “the nature of their job in order to discern how performances might be improved” (Stenhouse, 1988, p. 46). What is distinctive about the art of teaching is that it “expresses in a form accessible to learners an understanding of the nature of that which is to be learned” (Stenhouse, 1988). Stenhouse makes this point in order to emphasize that teaching is not about the mere transmission of knowledge or skill, but always involves what he refers to as “the epistemology” of a particular discipline or field, that is, “the nature of its tenure on knowledge” (Stenhouse, 1988). “Teaching tennis is about understanding the logic and psychology and techniques of the game and about expressing that understanding through skill in teaching” (Stenhouse, 1988). Whether teaching is concerned with knowledge, the arts or with practical skills, makes no difference with regard to the requirement that “the teacher should aspire to give learners access to insight into the status of what they learn” (Stenhouse, 1988). This is as much a requirement for the teacher as it is for the student, as “good learning,” as Stenhouse puts it, is “not mere doing [but] is about constructing a view of the world” (Stenhouse, 1988, p. 47).

When, against this background, Stenhouse then (re)turns to the question of research, it is to highlight research as an inextricable dimension of art, not something that comes to it from the outside, tries to steer and direct it from the outside, and thus seeks to gain control over teaching from the outside. “All good art,” Stenhouse writes, “is an inquiry and an experiment” (Stenhouse, 1988, p. 47). Yet is it important to see that such inquiry and experiment is not the inquiry and experiment of the so-called “scientific method”—the agricultural approach which Stenhouse clearly rejects—but is the ongoing investigation of the complexities of one’s own practice and one’s own art. And the reason for this is not to increase control over education as a process of production but, as already mentioned before, to improve one’s own artistry. Stenhouse makes the interesting claim that “the purpose of the artist’s research is to improve the truth of his performance” (Stenhouse, 1988). Artists—Stenhouse mentions Leonardo, George Stubbs, Nureyev, Solti and the Chicago Symphony Orchestra, and Derek Jacobi—are all “engaged in inquiry, in research, in development of their own work” (Stenhouse, 1988). And while this will involve “improvement of technique, it is not for the sake of technique [but] for the sake of the expression of a truth in a performance” (Stenhouse, 1988). Teaching needs technique, so we might say, but the technique is never more than a means for enhancing one’s teacherly artistry. Improving teaching—improving one’s own teaching—is therefore a matter of “the development of understanding expressed in performance: understanding of the nature of knowledge expressed in the art form of teaching and learning” (Stenhouse, 1988, p. 50).

The final point Stenhouse makes, is for teachers to work together in the pursuit of enhancing their artistry. “I can exercise my art in secret, or even in a small group of consenting adults,” Stenhouse writes, but “if I want the support of a movement, I need to make alliances and develop some political power” (Stenhouse, 1988, p. 48). In this context Stenhouse mentions the “teacher-as-researcher” movement in Britain, suggesting that ideally universities and colleges of education should work together with teacher groups. What is required for this to happen, so Stenhouse argues (and we shouldn’t forget that he is writing in the beginning of the 1980s), “is that [universities] break the stranglehold of the ‘psycho-statistical and nomothetic paradigm’ of educational research” (Stenhouse, 1988). Stenhouse proposes case study as a much more appropriate “form” for enhancing one’s art, also because it “turns one toward one’s professional work rather than away from it”—a “gesture” he also recommends for teachers’ further study and development. His ideal—which, as he concedes, may be “so radical that I may not be communicating it” (Stenhouse, 1988, p. 50)—is for the emergence of communities of teachers “whose attention is primarily focused on the art of teaching,” just as “a company of actors does” (Stenhouse, 1988). This means that any inquiry that may take place should express itself “in performance of his or her art rather than (or as well as) in a research report” (Stenhouse, 1988, p. 51).

Concluding comments: reclaiming the artistry of teaching

In this chapter I have tried to make the case for seeing teaching as an art and for the importance of putting the artistry of teachers at the very center of our understanding of what teaching is about. I have tried to make this case in a clear and in a sense rather “basic” manner. I have done so by setting out the main characteristics of teaching, by reconstructing Aristotle’s insights about the domain of the “variable” and the roles of (the art of) *poiesis* and (the art of) *praxis* in this domain, and by exploring insights from Lawrence Stenhouse about the particular artistry of teaching. In one way I would say that the case is clear and straightforward and difficult to contest; but in another way I am acutely aware that many forces in contemporary educational theory, research, policy and practice

are strongly moving or have already strongly moved into the opposite direction, that is, constructing teaching as a “delivery system” and making sure that the delivery of the desired “outcomes” is done in the most effective and efficient way which, so it is claimed, requires that teaching becomes evidence-based.

While such arguments sound neat and attractive—also because they often come with the promise that they can “fix” education—they amount, in my view, to a misunderstanding but also a misrepresentation of the complexities of education and the work of teachers. Whereas Lawrence Stenhouse was still able to point a finger toward researchers based in universities as having a problematic conception of what “real” research was supposed to be, in our times I am worried that many teachers have actually adopted the agricultural logic of interventions and outcomes as the way to engage with and enhance their own practice. In this sense the ambition to reclaim the artistry of teaching is not just directed against particular strands of policy and research, but also entails a difficult but nonetheless important conversation with the teaching profession itself—and to speak in the singular here is perhaps no longer adequate.

I am also aware that my case for “reclaiming” refers back to older discussions and older scholarship and may, in this sense, be perceived as nostalgic move; a longing for a past that no longer exist and also no longer should exist because “the times have moved on.” In response I would like to suggest that “the times” may move on, but that there is always the need for us to judge whether “the times” are moving in a desirable or in a problematic direction. This point is not just political, but it is, in my view, also profoundly educational. After all, parents who just say “yes” to anything their children ask for, will most likely turn them into spoiled brats, rather than helping them to come into a relationship with their desires and acknowledge that not everything that “arrives” as a desire is automatically desirable. Education has, in other words, always also a “duty to resist,” as Philippe Meirieu has called it (see Meirieu, 2007). Rather than just keeping up with “the times,” there may be good reasons for teachers to see themselves as “untimely” professionals, as professionals who are “out of time” (on this idea see Kelchtermans, 2012), precisely so that they can keep a perspective on all the desires that policy makers, politicians, researchers, but also parents and students and society at large project onto education. In this regard, reclaiming the artistry of teaching may be the very act of resistance education may need in order to keep a sense of direction in turbulent times.

Introduction

For decades countries across the world have reported shortages of teachers in some form or other, be it for certain subjects, in certain geographical locations or in some types of schools. There have been widespread media reports of teacher shortages in England (Bofey and Helm, 2015; Hazell, 2018; Sky News, 2017), the US and elsewhere (Caitlin, 2017; Passy, 2018; Strauss, 2016; Williams, 2018).

As pupil populations are projected to increase dramatically, international organizations, such as the OECD (Schleicher, 2012) and the European Cooperation in Education and Training, have called for the issue to be addressed urgently, and for a new approach to tackling teacher shortages (European Commission, 2015). Successive governments in many countries have invested in a raft of strategies and initiatives to address this issue, but the problems prevail. Much research has been funded and conducted around the world, but we are no closer to finding a long-term solution. One reason is because previous work has tended to look at teach shortages from a single perspective or only as a snapshot of the overall problem.

The demand for and supply of teachers are potentially influenced by a complex interaction of factors, but earlier work has tended to consider only a few factors in isolation. This kind of focus distorts the relative importance of some factors and so give misleading answers to the issue. Most studies of the supply pipeline also exclude through the research design, those individuals who do not apply for teaching or who have dropped out (e.g. Matthias, 2014; Heinz, 2015), ignoring the very people who can best explain the barriers to teaching (see Gorard, 2013). Relying on these kinds of studies for evidence, policy solutions consequently tend to be short-term and directed at economic and school environment factors, largely ignoring structural, societal and sociological ones. It is therefore not surprising that many of the current approaches to solving teacher shortages involve the use of monetary incentives (such as bonus incentives, higher wages, bursaries and scholarships), reduction in teachers' workload, and providing professional development, mentoring and induction for novice teachers. All of these are aimed at making teaching more appealing to attract and retain teachers, as reported by existing teachers themselves.

Given that current evidence on teacher demand and supply is based on partial understanding of the issue, initiatives to improve recruitment and retention based on monetary inducements are then not likely to be effective or appropriate. This explains why despite heavy investment in such programs the shortages persist, especially in subjects like maths and science. Most of these government and other initiatives have also never been robustly evaluated for independent evidence of their impact.

To address a complex issue like teacher supply would require a comprehensive approach that looks at the different factors together. In this article we describe our multi-pronged research approach, which includes policy documentary analysis looking into how policy decisions regarding planning on teacher numbers, curricular reforms in education and changes in admissions policies regarding teacher training can impact on teacher demand and supply. It also involves a time-series analysis to explore the complex interactions among the many variables associated with teacher demand and supply. To understand the issue better, we need also to consider individuals' decision-making process in their choice of teaching as a career. Therefore, we conducted a survey to understand undergraduates' career motivations. In addition, we synthesized existing international evidence to identify

potentially successful programs or interventions to attract and retain teachers. The combination of the four approaches provides a more complete picture for a targeted strategy to tackle the recurring teacher supply problem. This is, we believe, the first study that presents evidence from such a holistic approach.

This article summarizes the findings from the four strands of the study. We hope that this provides an example that can be developed for future research on the complex issue of teacher shortages. For this study, we used data from England and the focus is on the secondary sector where the shortage is most critical and chronic. We begin with an analysis of the supply issue and its possible causes, before moving on to examining why some people choose to go into teaching while others do not, or are hesitant. The latter is useful in designing policies to attract and retain teachers in the profession. Finally, we review international evidence to identify approaches that have the most promise in getting more people to teach in challenging areas, schools and shortage subjects.

Why don't we have enough teachers?

To get a better insight into the longstanding issue of teacher supply, we did a time-series analyses of official data from the DfE on number of schools and pupils, the School Workforce Census on teacher numbers, UCAS (Universities and Colleges Admissions Service) data on applications and acceptances into initial teacher training. Because education reforms can influence the demand and supply of teachers, we analyzed policy documents including reports from the School Teachers' Review Body, National College of Teaching, National Audit Office, Public Accounts Committee, the Houses of Commons and the Universities UK.

Lag time between pupil and teacher numbers

The number of teachers needed is assumed to be largely based on the projected pupil population, pupil:teacher ratios (PTR), and projected number of teachers entering and leaving. Such estimations are then likely to indicate a "shortage" because if the proportion of pupils enrolled is increasing, the rate of growth of the school population will exceed for a few years the number of graduates and teacher trainees from which potential teachers are drawn. Teachers take time to develop. For example, in England pupil numbers rose sharply from 2014 onwards (Fig. 1) but teacher numbers continued to fall from a peak in 2010. This was seen as the beginning of a teacher supply crisis. However, if we look at the numbers over time, the number of teachers available has tended to change with changes in pupil numbers although perhaps lagging behind pupil numbers by a year or so.

Similarly, the rise in PTR to an almost historic high in 2019 was a cause for concern, but this was not unexpected as pupil numbers had been increasing rapidly since 2014 (Fig. 2). Changes in the national PTR are largely due to the differential rates of growth in pupil and teacher numbers rather than simply a lack or surplus of teachers. In recent years, the PTR reached its highest point at 17.1 in 2004 before dropping to 15.5 in 2010. This was because teacher numbers continued to increase while pupil numbers were falling. The drop in PTR during this period was probably at least as much determined by the fall in pupil numbers from 2004, as the time lag before teacher numbers also began to fall. In summary, teacher numbers have historically kept pace with pupil numbers, and recruitment to postgraduate initial teacher training has generally responded to changes in intake targets albeit with a lag of 2 years or more.

Fig. 1 Number of FTE qualified teachers and pupils in state-funded secondary schools (1971–2019).

Fig. 2 Pupil:teacher ratios of qualified within school secondary teachers (1971–2019).

Limitations of the teacher supply model

In England, as in many countries, the number of teachers needed each year is estimated using a statistical model. This is known as the Teacher Supply Model (TSM). In the US, they have the TSDQ (Teacher Supply Demand and Quality) project models. TSM estimates the number of teachers needed based on the predicted number of pupils, the number of teachers leaving and the economic conditions, as well as how schools might react to these. Such factors are difficult to predict with certainty, and are usually beyond the control of the government. Information on the number of teachers is collected from the School Workforce Census, which is a snapshot measure carried out in November (from 2010 onwards), and therefore too late to influence recruitment for that academic year (House of Commons, 2017). This may underestimate the number of teachers needed as schools would have filled their September vacancies by using unqualified or supply teachers as a stopgap measure to ensure that classes are manned when term starts in September (House of Commons, 2017).

Government policies that increase demand for teachers

Sudden changes in government policy decisions can complicate planning for teacher supply. While TSM builds into its formula such policy changes, it can only do so when policy decisions have been confirmed. Where they are not confirmed, planning has to be based on a range of scenarios and a central estimate is often created and used (DfE, 2017). The NAO analysis suggests that these scenario-based estimations can vary between 25,000 and 38,000 in total number of teachers (National Audit Office, 2016a).

For example, from 2013/2014 onwards, the number of teachers recruited have consistently failed to meet the recruitment targets (the estimated number of new teachers needed). This shortfall became increasingly more apparent from 2015/16 onward where under 80% of the targets were met each year (Fig. 3). The number of subjects failing to meet targets had also increased. Many attributed this to the economic recovery, difficulties in getting new graduates into teaching because of competitions with other jobs, relatively poor pay of teachers and heavy workload of teaching (Borman and Dowling, 2017; Eteach, 2018; Foster, 2018; Hayes, 2017; Hobson et al., 2009; Public Accounts Committee, 2018).

But few have considered the influence of government policies. During the same period from 2013 onward, a number of education reforms were brought in. The leaving age for education and training was extended from 16 to 17 in 2013 and to 18 in 2015, the new¹ English Baccalaureate (EBacc) was introduced, and the GCSE curriculum was reformed (where the option to take Core Science was removed from 2016 so that some pupils would have to take two science subjects instead of one at GCSE). All these new policies have the effect of increasing the demand for teachers especially in traditional shortage subjects.

But the TSM is unable to plan ahead, and recruitment targets were only raised in the year when these policy changes came into being. This sudden and substantial increase of targets, for example, by 20% for maths and 30% for science within a year is likely to be problematic.

¹The EBacc is a school performance indicator where schools are measured on the number of pupils that take GCSEs in core subjects, including English, maths, the sciences, one humanities (history or geography) and a language, and on how well their pupils do in these subjects.

Fig. 3 Number of postgraduate ITT entrants and targets (total secondary).

Fig. 4 Percentage of first degree graduates to be recruited into teaching to meet the ITT targets. Sources: <https://www.hesa.ac.uk/data-and-analysis/students/table-25#> and Initial Teacher Training: Trainee Number Census. <https://www.gov.uk/government/collections/statistics-teacher-training>; <https://www.hesa.ac.uk/data-and-analysis/students/table-25>.

And even if the number of new teachers required could be accurately predicted, it is still not possible to increase the number of graduates within a year since estimations are planned only 1 year in advance. If the targets for initial teacher training were to be met, we would need to recruit close to 50% of maths and 36% of physics graduates (Fig. 4). And these are subjects where there is reported unmet demand from industry and other employers as well.

Time is needed for the growth of graduates to meet the increasing demand. Teacher shortages are therefore, partly created by government policies as much as the mere increase in pupil population.

Policies that suppress supply of teachers

While some government policies have indirectly led to an increase in the demand for teachers, as illustrated above, other well-intended policies may actually have the effect of suppressing the supply of teachers. Although no one factor alone can be responsible for the teacher supply crisis, taken together they can exert considerable influence.

For example, in 2013 there were changes to the admissions policy to higher education institutions for teacher training. The then education secretary reduced the number of training places in higher education institutions, while at the same time increasing the

Table 1 Failure rate of skills test for 2012/13 to 2017/18.

Year	2012–2013	2013–2014	2014–2015	2015–2016	2016–2017	2017–2018
No. of trainees failed	3560	3639	4087	4202	4243	3748
Percentage failed	8%	9%	10.5%	10.5%	10.5%	9.5%

number of school-based training. As initial training for secondary school teachers (particularly for maths and science) was traditionally undertaken via university-led postgraduate courses, such policy decisions potentially reduced the number of people that can be trained. There were reports that School Direct (school-based training provider) was unable to fill a large number of places, leading to schools having to return their allocations to the² National College of Teaching and Leadership (NCTL). But NCTL did not allow allocations to be transferred between routes and subjects (National Audit Office, 2016a; Universities UK, 2013). So, while universities were oversubscribed they were not allowed to increase the number of training places allocated to them leading to many qualified applicants being turned away. We thus lost a large number of potential teachers even before the start of the pipeline.

At the same time, admissions into teacher training were made more difficult with the raising of the minimum entrance requirements and the Skills Test, which costs £24 each attempt. The Skills Test is a test of literacy and numeracy, which applicants had to pass before they can commence training. Applicants were allowed only three re-sits, and had to wait for 2 years before they could have another go (DfE, 2012). Around 10% of applicants failed the test every year (Table 1). In April 2019, it was discovered that over 200 potential trainees between September 2017 and 2018 were wrongly told that they had failed because of a marking error. Although passing the Skills Test is now no longer a requirement prior to training, the fact that thousands of people have applied to take the skills test indicates interest in teaching.

Government policies to raise the quality of teachers and thus teaching as a profession may have led to some risk-averse practices by teacher training providers, which have curtailed the numbers entering teaching. UCAS data show in the period from 2014 to 2017, the period when concerns of a teacher supply crisis were greatest, only under 60% of applicants were accepted into training (Fig. 5). In 2020, 15,080 applicants were rejected (see Fig. 11). Again, this shows that there is no lack of people interested in teaching.

Therefore, policies to increase the number of people going into teaching, such as bursaries, scholarships and bonus incentives may not be appropriate as the issue is not primarily a lack of numbers applying, but a mismatch between demand and supply. This mismatch, is to a certain extent, brought about government's own conflicting policies that have led to an increase in the demand for teachers while, at the same time, suppressing supply.

DfE's own analysis (Fig. 6) shows that those in receipt of higher bursary awards were less likely to end up teaching after qualifying than those awarded a smaller bursary (non-shortage subjects). Almost 20% of those awarded £25,000 or more (i.e. those training to teach maths and science) did not eventually go into teaching. This suggests that financial incentives alone are not the prime motivator for people to go into teaching.

Fig. 5 Applicants and acceptances to all ITT courses (for England only). Source: UCAS Teacher Training statistics—applicants and acceptances by end of cycle 2014, 2015, 2016, 2017, 2018, 2019, 2020. *Acceptance figures include those who have accepted their conditional offers.

²NCTL was an agency for the DfE whose function was to ensure a provision of sufficient number of qualified teachers and maintain the quality of the teaching profession with oversight of the training of teachers. It has since been abolished.

Fig. 6 Percentage of award recipients in teaching posts by the size of bursary award (2009/10–2015/16). Source: <https://www.gov.uk/government/statistics/teachers-analysis-compedium-4>.

Bursaries and other incentives might only attract people to train who have no intention to stay on as teachers (Higher Education Policy Institute, 2017). Doubts about the usefulness of bursaries and incentives to attract teachers have been expressed by the National Audit Office (National Audit Office, 2016b), and other commentators.

Yet as recently as October 2021 Boris Johnson, the British Prime Minister, announced a £3000 bonus incentive to entice new teachers in STEM subjects to teach in disadvantaged areas. Historically such schemes have been tried before in the UK and other countries, and have shown not to work (e.g. Clotfelter et al., 2008; Fitzgerald, 1986). This kind of policies are based on prior flawed research suggesting that teachers are motivated by financial gains, and offering such incentives can make the teaching profession and specific schools more attractive to current and potential teachers.

Individuals' choice of teaching as a career and their decisions to stay in teaching or not are generally not determined by government policy. There are deeper social and structural factors that account for people's behavior.

Who wants to be a teacher?

Looking at the data over time from 2009/10 to 2015/16 (Fig. 7), humanities students, maths, design & technology, biology and physical education teacher trainees were the most likely to continue into teaching (over 87%) after training while, physics, computing and modern languages trainees were less likely to go into teaching after qualification (c. 82%).

Fig. 7 Percentage of bursary holders in teaching in state-funded schools in England (between 2009/10 and 2015/16) by subjects.

This is consistent with our survey findings, which show that the strongest predictors of who is likely to have considered teaching are students' choice of subjects at university, their university entry qualification and their predicted degree classification (Gorard et al., 2021).

In our survey of c.5000 undergraduates in 53 universities in England across all disciplines, we asked students what they looked for in their career, the sources of information about careers they find useful, whether they have considered teaching, and which factors attract them to, or deter them from, teaching. We also collected information about parental occupation and education and the level of qualifications of respondents, and whether they felt that they could easily find a range of jobs. Crucially, our survey differed from many previous similar surveys in that we included undergraduates who have never considered teaching as a profession and those who had but decided not to be a teacher as well as those who have expressed firm intention to be teachers. Policies to attract people into teaching would do well to consider who is likely to be attracted to teaching. It would not be useful to try to recruit those who have never considered teaching. These are people studying subjects like law, medicine, dentistry or architecture, with clear professional outcomes. Likewise, the group who have firm intention to teach have already made the decision to go into teaching, so efforts to entice them into teaching will be redundant. It is the views of the middle group, those who have expressed interest but have decided against it, that any recruitment efforts should focus on. Findings of most previous work that focused only on those firmly intending to become teachers are misleading. For this group, the strongest predictors are their career concerns, such as pay, status and career prospects (Gorard et al., 2021) leading many researchers to conclude that addressing the relatively low pay, poor career progression and workload is a way to improving recruitment.

Our survey findings suggest that there are important differences between intending teachers and those who have expressed interest but do not intend to be teachers. It is this distinction that policy aimed at recruiting shortage subjects like maths, physics and chemistry should be focusing on.

Characteristics of potential teachers

Prospective teachers tend to be from less educated families with less prestigious occupational backgrounds and lower university entry qualifications (Table 2). They are more likely to enter university with a vocational qualification (e.g. a BTEC, GNVQ) and to expect lower degree results (Table 3) than their peers. Prospective teachers have lower tariff points on entry qualifications compared to those who have not considered teaching or had no intention to teach (Table 4). They are also more likely to study generic subjects like sport, English, classics, and history (Table 5). All of this suggests that higher attainers are less likely to be interested in teaching as a career.

However, student background characteristics, prior experiences and course choices are not malleable in the short-term, and so these differences do not help much in deciding how to attract more people into teaching. The kind of courses that students take is closely related to their career intention, suggesting that many have already made a decision prior to entry to university. To increase the number of teachers in some shortage subjects, like maths and science, might require an approach that targets students before they make their subject choice at university.

Career motivations of intending teachers and non-intending teachers

When students were asked to rate what they considered important in their choice of career (from 0—not important at all to 10—very important), the majority rated job satisfaction/enjoyment, subject interests, career prospects, job security and pay/salary (Table 6). Workload, incentives to train, introductory bonus and job status are least of their concerns.

But when the responses of those who have considered, intend to be teachers and those who have not considered teaching were compared, the differences between groups become apparent (Table 7). Potential teachers are more likely to report being motivated by having a chance to share their knowledge and give something back compared to their peers. They are less concerned with job status, career prospects and pay (column one). Perhaps this is why studies that focus only on teachers might downplay the importance of these extrinsic motivators in comparison to the more altruistic ones. For those who might otherwise have chosen teaching as a career, pay and career prospects seem to be more important to them. Crucial findings like this are lost when we consider only those who want to teach.

Table 6 Factors influencing students' career choice.

	<i>Mean</i>	<i>Standard deviation</i>
Job satisfaction, enjoyment	8.77	1.44
Interest in my subject area	7.66	2.33

Pay	−0.23	−0.27

Note: Comparison is made between those who have considered teaching, those who intend to teach with those who have not considered teaching. The difference is expressed as effect sizes, calculated as the difference in means between the groups and the overall standard deviation.

Those who have considered teaching are also more likely to be influenced by financial incentives to train compared to those who have not considered teaching (Table 8). Financial incentives appear to be attractive to those who are already interested in teaching, but not those who have not considered teaching. To attract those who might have considered teaching to become teachers, policies would need to focus on job satisfaction, career prospects and subject interest, rather than money alone. This is where current government policies to increase the number of people into teaching (particularly those in STEM subjects) has failed to consider.

Table 8 Influence of financial incentives to teach (effect sizes).

<i>Incentives to teach</i>	<i>Considered</i>	<i>Intend</i>
Bursary for training	+0.48	+0.62
Training salary	+0.47	+0.58
Loan for tuition	+0.42	+0.58
Loan for maintenance	+0.40	+0.57

Key factors differentiating the three groups

To identify the important factors distinguishing the three groups, further analyses using logistic regression modeling were conducted. The first model compares those who had considered teaching and those who had not. The second model compares those who had considered teaching and indicated that they intended to teach with those who had considered but were not intending to teach.

The predictive factors included student family background, year of study at university, factors influencing their career motivation, sources of information about careers, perceptions of teaching as a career, and the role of financial incentives to become a teacher. These factors were added in chronological order with financial incentives added last to see how much each factor explains differences between groups.

The analyses show that the strongest predicting factors are those related to students' university years (Table 9). In other words, if we have information about factors related to students' subject choice at university, year of study, their university entry qualification and expected degree classification, we can predict with 66% accuracy who had considered teaching and who had not (model 1), and 71% accuracy (model 2) who had considered teaching and intend to teach or not. Adding these factors increases the accuracy of prediction by 4% points in model 1 and 5% points in model 2.

Among those who had considered teaching, the factors that most predict who would go into teaching or not are students' career motivations. Adding these factors increases the predictive accuracy by eight percentage points. Net of these factors, knowing students' perceptions of teaching as a career does not help much in predicting if they intend to teach or not. When comparisons are made with these two groups, financial incentives are not the deciding factors in students' intention to teach. Such incentives are important to those who are already considering teaching, but do not make a difference to their decision to teach or not.

These findings suggest that there are deeper, structural reasons for graduates' choice of teaching as a career, which may not be amenable to financial manipulations. Psychologists have long believed that such extrinsic motivators do not alter attitudes that underlie human behavior (Kohn, 1994). People are concerned about money only if they are not paid well. Therefore, research that asks people what matters to them in their choice of career, money/salary is often top of the list, but if they were asked what they care about, money becomes less important (Kohn, 1993). As Herzberg has argued, just because low pay is a disincentive, paying people more does not necessarily increase motivation to teach.

Most previous research on teacher shortages often conclude that the relatively low pay, poor career progression and workload as factors. These tended to be based on economic theory of reward and motivation. Sociological studies on choice of career and participation in training suggest that, to a certain extent, individual's choice of career is influenced by their socio-economic and cultural background (Gorard and Rees, 2002; See, 2011; Gorard et al., 2021). Therefore, a sociological model may provide a better explanation for individuals' choice of career thus offering a partial explanation for why the bursary schemes are not the ultimate solution. This has implications for future policy on teacher recruitment and retention.

Table 9 Regression models to predict who are likely to consider teaching or not and those who intend to teach.

How to attract and retain teachers?

The survey result, the time-series analysis and policy analysis have suggested that current initiatives to increase teacher recruitment and retention through monetary incentives and workload reduction can only offer partial and short-term solutions to the teacher supply crisis.

To understand what approaches are most effective in attracting and retaining teachers, we reviewed and synthesized international research that evaluates strategies used to address teacher shortages. Knowing more about what “works” and what does not will allow policymakers and schools to make informed and targeted decisions on strategies to use. As the findings are meant to inform policies, it is essential that the evidence supporting these strategies is based on rigorous research. To ensure that the findings are reliable and free from bias we subjected each study to a quality appraisal using a “sieve” heuristic (see [Table 10](#)). This process rates each study based on its research design, scale, level of attrition, and outcome measures, which are key factors that can affect the validity of the results. Each piece of research is then assigned a score in the form of a padlock rating indicating the security of the findings. For more details on how to use the “sieve,” see [Gorard \(2021 p. 94\)](#).

The review identified 6731 potentially relevant titles from a search of the standard social, educational and psychological databases, e.g. JSTOR, Web of Science, Science Direct, ERIC, EBSCOhost (which covers the following databases: PsychINFO, British Education Index, PsycARTICLES, etc, ProQuest, International Bibliography of the Social Sciences, Google and Google Scholar. Another 347 studies from prior reviews or previously known work were added to the list. Of the 7078 studies, 120 deemed relevant to the research question were retained for data extraction, and their findings synthesized (see examples in [Table 11](#)). Details appear in [See et al. \(2020a\)](#).

Promising approaches for attracting teachers to schools

The only approach that appears to work in attracting teachers to hard-to-staff schools and areas (not into the profession) is the offer of financial incentives. However, these incentives do not offer long-term permanent solutions. A number of studies reported that bonus incentives can help increase the number of existing teachers in low performing schools ([Glazerman et al., 2013](#); [Steele et al., 2010](#)) and schools with a high proportion of disadvantaged pupils ([Fitzgerald, 1986](#); [Hough and Loeb, 2013](#)). But the impact is temporary, and lasts only while the incentive is available. Once the money stops (or even before), the teachers leave at the same rate as before.

Monetary incentives also work in attracting teachers to challenging schools, but only for relatively high performing schools with lower proportions of disadvantaged children ([Fulbeck and Richards, 2015](#); [Henry et al., 2012](#)). It is also the case that such incentives are effective only in attracting those who are already interested in teaching ([Rosen, 2012](#); [Dolan et al., 2012](#)). To get teachers to teach in challenging communities and school would require paying teachers substantially more to compensate for factors that might make the community or schools less attractive, such as costs of living and working conditions ([DeFeo et al., 2018](#); [Falch, 2017](#); [Goldhaber et al., 2010](#); [Zarkin, 1985](#)). Financial incentives are also only effective where there is a tie-in. In Norway, for example,

Table 10 The quality appraisal “sieve” for causal studies.

<i>Design</i>	<i>Scale</i>	<i>Dropout</i>	<i>Outcomes</i>	<i>Other threats</i>	<i>Rating</i>
Strong design for causal research question (e.g. RCT)	Large number of cases per comparison group	Minimal attrition with no evidence that it affects the outcomes	Standardized pre-specified independent outcome	No evidence of diffusion or other threat	4🔒
Good design for causal research question (comparison such as regression discontinuity, difference-in difference)	Medium number of cases per comparison group	Some initial imbalance or attrition	Pre-specified outcome, not standardized or not independent	Indication of diffusion or other threat, unintended variation in delivery	3🔒
Weak design for causal question (e.g. matched comparison using propensity score matching)	Small number of cases per comparison group	Initial imbalance or moderate attrition	Not pre-specified, but valid outcome	Evidence of experimenter effect, diffusion or variation in delivery	2🔒
Very weak design for causal question (poor comparison with no equivalence, e.g. comparing volunteers with non-volunteers)	Very small number of cases per comparison group	Substantial imbalance or high attrition	Outcomes with issues of validity and appropriateness	Strong indication of diffusion or poorly specified approach	1🔒
No consideration of design	A trivial scale of study (or N unclear)	Attrition not reported or too high for comparison	Too many outcomes, weak measures or poor reliability	No consideration of threats to validity	0

	Goldhaber et al. (2010) Fowler (2003) Gordon and Vegas (2004)		1A

As this table portrays, there is no very strong research in this area at all.

teachers working in high-vacancy schools receive a wage premium while there, but they lose this once they move to a low-vacancy school (Falch, 2017). Other studies (e.g. Bueno and Sass, 2016) found that paying shortage subject teachers (e.g. maths and science teachers) higher salaries did not increase the number of maths or science teachers nor did it encourage people to switch to maths or science.

There are studies that include a range of other approaches (e.g. professional development and mentoring) alongside offers of financial incentives or bonuses, thus making it difficult to determine if it is the attraction of the money, the mentoring or a combination that drive the effects. For example, Bobronnikov and Price (2013) suggest that an incentive grant increased the number of recipients teaching maths and science in high need areas, but the program also came with a 5-year tie in and other mentoring and professional development support. Similarly, Scott et al. (2006) reported an increase in the number of people recruited to teach maths and science under a program that offered a scholarship. But the program also involved a 2-year commitment plus mentoring and tuition fee waivers. Others, like Rothstein (2015), suggest that bonus contracts were effective in attracting teachers of higher ability, but the impact was small. The tenure contract was more successful in increasing the number of high ability teachers as lower ability teachers would leave voluntarily because they know that their chances of tenureship are low. One problem with this research is that it assumes that teacher performance assessment is unbiased and that new teachers are recruited from the same population as current teachers ignoring the fact that there are potentially high ability teachers who would not consider teaching at all. One side effect of higher salary for tenureship is that class sizes or pupil:teacher ratios need to be increased to finance the higher teacher salary.

These incentives are not usually intended to attract more people into teaching, but merely to move existing specialist teachers to new areas. Unless there is a surplus of shortage subject teachers available to be deployed, enticing teachers to some areas might leave other areas understaffed. That could result in a fairer distribution of teaching resource, but it would be an equality of insufficiency. There are some suggestions from less robust correlational studies that financial incentives alone may not be enough to compensate for poor working conditions, issues with school leadership and school climate (Waters-Weller, 2009; Fulbeck, 2014).

Also, even if offering higher salaries can encourage more people into teaching, we need to ask if we really want people who are attracted by salaries alone. The preceding two sections have shown that those who are attracted by bursaries and scholarships are less likely to enter teaching after qualification and more likely to leave anyway. Money does not fundamentally change people's decision to teach or not. Individuals' career intentions are part of a longer-term "identity."

Other weaker studies in terms of research design for a causal question show mixed results. One study looked at offering highly qualified people a \$20,000 bonus incentive to switch careers to teach in high need areas (Fowler, 2003). Despite advertising across states, only seven candidates outside the state were recruited over 4 years. The program also failed to place all teachers in high-need schools. Dropout among bonus recipients was higher than the national average. Head teachers reported that bonus recipients were more attracted to the fast-track scheme than the bonus incentive (Churchill et al., 2002). Other studies also suggest that generally the effect of bonus incentives tends to be short-lived (Choi, 2011).

Overall, there is no strong evidence that monetary inducements work. Salary increases (within the usual ranges), bonuses and cash incentives do not attract people to teaching (Gorard et al., 2021). Bonus incentives, like the one that the UK Prime Minister promised at the 2021 party conference, are an apparent quick fix with no lasting effects. Moreover, incentives to try to attract teachers to specific local areas or schools could be at the expense of other schools, so may not benefit the system as a whole.

Apart from financial incentives, there is no good evidence that other approaches to attract teachers to teach in difficult-to-staff areas or shortage subjects work. This is largely because research on these approaches is not even as strong as those for initiatives involving monetary inducements (See et al., 2020b). Of course, it is possible that better research in some of these areas has been conducted since our review. Therefore, our understanding of what works or not and in what context will be revised accordingly as more and better studies are conducted.

Approaches, like Grow Your Own, for example, where teachers are trained and recruited from the local community, have not been robustly evaluated. The current evidence we have is that we do not know if such an approach works or not. Research in this area has tended to be small-scale and based on anecdotal reports of successful practice. It is, therefore, not possible to draw causal conclusions. We cannot say definitively that the strategy leads to increasing number of teachers, or if something else is happening—such as economic events which can encourage people to go into teaching, but have nothing to do with any concurrent initiative to attract teachers.

We also do not have convincing evidence that increasing the number of ways people can obtain qualification or accreditation helps improve recruitment, largely because the different routes are so varied in terms of the kind of people being targeted, and the extent to which they are actually different from the “traditional” routes on offer.

Teach for America (US) and its international equivalents, such as Teach First (England), Teach for Australia, and Teach for India, as well as other school-based training such as Schools Direct, Boston Residency program, School Centered Initial Teacher Training and the Troops to Teachers initiative are examples of alternative routes into teaching. The most promising study in this group is a Maths Immersion Program (MIP). [Boyd et al. \(2012\)](#) reported that the program was successful in attracting highly qualified teachers to teach in some of the most challenging schools. More teachers were trained through this route than the traditional college route and other alternative pathways, such as Teaching Fellowships (TF) and Teach for America. Similar studies also reported increases in the number trained via alternative routes (e.g. [Clewell and Villegas, 2001](#); [Harrell and Harris, 2006](#); [Papay et al., 2012](#)). While the results look promising, we have to consider that in most of these studies, participation in alternative routes was self-selected. Those who signed up for traditional programs were likely to be different from those who signed up for the online or alternative program. It is therefore not possible to rule out other exogenous factors, such as the graduate labor market conditions, which may have affected people’s decisions in changing careers. In some cases, candidates were pre-screened and selected for their potential success. None of the studies were able to effectively randomly assign recruits to the different types of program to test relative effectiveness. One study also suggests that the success or otherwise of alternative routes into teaching depends on the context within which they are implemented.

Promising approaches for retaining teachers

As with recruitment, the majority of the stronger studies on retention, in terms of research design, also involved some kind of financial incentives. However, the evidence is even weaker here. Although many studies do show positive results, the more robust studies which control for context suggest that money only keeps people in teaching or in the high need areas as long as the incentive is available. Such interventions are therefore not useful in addressing permanently the chronic shortage of teachers.

One such incentive is performance-related pay. Performance incentive pay may be effective in retaining effective teachers and removing less effective teachers. The assumption is that low-performing teachers would rather leave voluntarily than to be dismissed ([Dee and Wyckoff, 2015](#)). However, the effect is not clear cut. It depends on whether the incentive pay is awarded to individual teachers or to the whole school. [Springer and Taylor \(2016\)](#) found that individual awards are more effective for experienced teachers while school-level awards are more effective for beginning teachers. A randomized control trial also showed that school-level or group incentives may not be effective in retaining teachers ([Fryer, 2013](#)).

Other commentators have argued that financial incentives need to be large enough to neutralize the disadvantage of working in challenging schools or areas ([Booker and Glazerman, 2009](#)). However, the results are difficult to interpret. Dee & Wyckoff’s quasi-experimental study shows receipt of award improved retention, but regression discontinuity analyses ([Shifrer et al., 2017](#)) found that a large award had a negative effect compared to small award. This is perhaps because teachers in receipt of a large award are high performing teachers who can easily find better paid jobs elsewhere, and hence more likely to move. [Springer et al. \(2010\)](#) suggest that awards over \$6000 have no effect on teachers’ motivation to stay. So the amount and the implementation of such awards may be important considerations, as well as the fact that these incentive payments come with an agreement to commit to teaching targeted subjects or schools. Data from the Teacher Follow Up Survey showed that performance pay was not considered as the key reason for teachers’ decision to leave ([Jones, 2013](#)). In fact, the evidence suggests that the use of discriminatory incentives may even worsen overall retention.

In many cases, monetary incentives work only because teachers are required to commit to teach for a specified period or certain subjects in specified schools or areas as part of the contract agreement. These incentives often entail a penalty for breaking the contract, raising questions about the value of such an approach and the potential for a kind of enforced retention where teachers may feel “tied-in” to a role that they no longer wish to do.

Other financial incentives, such as loan forgiveness and one-off retention bonuses (e.g. [Feng and Sass, 2015, 2018](#)) targeted at beginning teachers teaching shortage subjects work only because there were strings attached to them. To be eligible for the loan forgiveness, beginning teachers had to agree to teach a shortage subject for 90 days and to be eligible for the retention bonus, teachers had to agree to continue teaching the shortage subject the following year.

Differentiated incentives to retain older teachers, with the amount paid varying by length of experience, have been not shown to work either ([Booker and Glazerman, 2009](#)).

Other approaches involving mentoring, induction programs, leadership support, flexible working, professional development and improved workload have not been robustly evaluated. And some studies show negative results. The jury is still out on most of these interventions.

Some correlational and survey-based studies suggest that improving school cultures and ethos can improve recruitment and retention. However, very few rigorous studies robustly evaluated such interventions related to areas such as accountability, teacher stress, working conditions, workload or leadership support. These are areas worth exploring further.

Implications for research, policy and practice

Our multi-strategy research approach combining survey data, time-series analysis of official data, policy documentary analysis and systematic review offers a comprehensive and holistic way of understanding the complex determinants of teacher demand and supply better. Tackling teacher shortages is a complex process involving multiple stakeholders, including policymakers, teacher education providers, schools and teachers. It requires longer-term, more joined-up planning than is usual, and well-resourced, evidence-informed policies, along with system-wide shifts in practice.

Our study finds that monetary incentives are not feasible long-term solutions to addressing the teacher supply problem. While they are important to those who are considering teaching, they do not make a difference in their decision to teach or not. Students' decisions to be teachers or not are largely mapped out by the time they are in university. Students' choice of subjects at university, their entry qualifications, their predicted degree classification and their parental occupation and education are strong determinants of who are likely to be teachers or not. However, these are not malleable, so knowing these differences is not very useful for policies to attract more people into teaching. But what we know is that teaching seems to be attracting lower performing students from less prestigious backgrounds. Perhaps, in the long-term, more thought could be put into how teaching could be made more attractive to those who would otherwise have chosen teaching as a profession. And this should be tackled much earlier in people's education so that by the time they reach university, whatever subjects they are studying, teaching will be seen as an attractive potential alternative for them.

Our analyses also show that there is no lack of people wanting to go into teaching. The fact that thousands have applied and been rejected every year suggests there is an artificial barrier to entering the teaching profession, unless of course, teaching is genuinely attracting tens of thousands of unsuitable candidates. We found that government policies on education can have a far more direct and immediate effect on teacher numbers than commonly cited reasons such as teacher salaries or workload. For example, government policies can increase or decrease teacher demand and supply almost overnight by changing mandatory class sizes, pupil:teacher ratios, entry requirements for teacher training, adjusting the number of training places available, reforming the way schools are funded and changing the number and types of schools (See and Gorard, 2020). Teacher shortages are therefore not simply the result of a growth in pupil numbers or the relative lack of attractiveness of teaching compared to other professions.

We have not found the "magic bullet" yet, but we are closer to understanding the determinants of the problem, and this is a positive step toward finding a solution. Almost any economic, legal, structural or cultural change over time could influence how many teachers are needed and/or how desirable teaching is as a career. A key finding is that policy interventions to address the challenge of teacher supply often only focus on the symptoms rather than the cause of teacher shortages. Our analyses of secondary data and government policies show that policies aimed at raising the quality of teachers can have the effect of reducing the number of teachers by raising the entry requirements. Therefore, balancing the quantity and quality of teachers needs to be carefully considered for their possible implications for teacher supply, and they need to be considered several years before actual implementation. The legislative programs of administrations in the UK are currently fragmentary and naïve in terms of timing.

Our new review highlights the gaps in many key areas of research (such as on workload). And most research in these areas is so poor (having no context, or such partial coverage) that it is of no use to inform policies. This is an issue for funders, universities, and governments to address. It is an ethical issue about the use of public funding and wasted opportunity costs as much as anything else.

More creative approaches to retention, such as those employed in business organizations, could be explored. This could include, for example, rewarding long-serving staff by offering sabbaticals for teachers after a certain number of years in post, to allow them to travel, conduct their own research or pursue further study. These ideas could then be tested properly to see whether they can help to reduce stress and burnout, and thus improve retention. Future research could focus much more on those young people who have considered teaching but rejected it to see how they could be enticed into teaching.

We could also consider the way in which school places are allocated, so that there are no clearly defined schools with such high levels of poverty as at present, meaning that certain schools might not be as hard to staff, even though some would remain geographically isolated. Of course, a wider and more effective solution would be to work beyond education to create better economic conditions in poorer areas anyway.

The education of immigrant¹ students is a humanitarian crisis given forced displacement of 79.5 million people, 40% of whom are children (UNHCR, 2020a). In 2015, war drove a million plus refugees to Europe and Scandinavia, including thousands of unaccompanied minors (Connor, 2016). In the US, which "has more immigrants than any other country" (Radford, 2019, para. 1), one in four children under age 18 is an immigrant or a child of immigrants (Sugarman, 2019). Since 2011, 6.6 million people have fled Syria, escaping civil unrest (UNHCR, 2020a). Consequently, many countries are receiving newcomers who are challenging prevailing notions of teaching *well* and teaching *all*, in a world context where equitable education remains unrealized (OECD, 2018). Clearly educational interventions are needed.

These interventions are especially urgent given international data showing that immigrant students lag behind non-immigrant peers academically (APA and Presidential Task Force on Educational Disparities, 2012; OECD, 2016), report less sense of belonging, frequently attend segregated schools (OECD, 2015, 2018), and face numerous barriers, including insufficient language learning programs (Bartlett, 2015). We offer insight into teacher preparation for increasing diversity in classrooms, especially due to increasing newcomer students, through three mini case studies, each utilizing a distinct lens: teachers' lives; teachers' work; teachers' professional education. First is the case of Turkey which hosts the largest number of refugees worldwide (UNHCR, 2020d). The dramatic influx of refugee students into Turkish schools has accelerated local research on the issue, illuminating critical issues as well as teachers' professional development needs. The second case focuses on the work of community-based teachers of immigrant students. Here, both teachers and students are Latinx immigrants, affording a deeper understanding into immigrants from Latin America and Mexico who represent a sizable portion of immigrants globally (Noe-Bustamante and Lopez, 2019). Our third case examines the lives of immigrant teachers who originate from Asia, South America and the Caribbean but all teach in New York City, a destination city for newcomers to the US. These three cases tell a story of teacher preparation for immigrant students from the macro to the micro, from the vantage point of teachers, the students they serve, and the system in which they work. While each case offers recommendations for practice, our article concludes with a cross case analysis, enabling larger principles to emerge.

¹For simplicity, we use the term "immigrant" inclusively to encompass immigrants, migrants, and refugees.

In an effort to actively resist opportunity gaps, barriers to schooling, and teachers' pedagogical missteps that can sideline and other immigrant students, we frame our three mini cases within what we term, *Newcomer Unothering Pedagogy*. Schooling for immigrant children has long promoted conformity through culturally oppressive practices as opposed to liberatory, agentic transformation (Goodwin, 2010, 2020; Ladson-Billings, 2014; Yosso, 2005). "Whiteness as the 'invisibilized' norm against which difference is measured, constructed, and maintained" (Daniels and Varghese, 2019, p. 57) overtly and covertly enables the pathologizing and marginalizing, i.e., othering, of immigrant children by relegating them to the peripheral spaces in schools, obscuring their humanity, diverse histories and needs. *Unothering* is "critical action" (Goodwin, 2010, p. 3127) that consciously counters othering.

Newcomer Unothering Pedagogy (NUP) cultivates a sense of belonging as the essence of educating immigrant children, honoring the multiple identities they bring through their lived experiences and rich funds of knowledge (Moll et al., 1992). For newcomers, belonging is much more than simply fitting in or being included. Newcomers join an unrecognizable environment full of strangeness. For instance, newcomers may know the institution called school, yet it is likely that the norms–rules, regularities, organizational structures, languages and literacies, even the materialities of the school they enter is a version of which they have little familiarity. Teachers who enact NUP understand the multilayeredness of belonging, that newcomers are marked in countless ways as *alien*—from the clothes they wear to the way they comport themselves, and so aim consistently to redefine and deliberately structure and facilitate inclusion, community and belonging along those many dimensions.

NUP teachers direct their pedagogical practices toward the culturally relevant, sustaining and socially-just, centering immigrant children's "unique ways of knowing and integrating culturally meaningful content into the curriculum" (Goodwin, 2020, p. 11). These unique ways of knowing are culturally grounded, but also transnationally fluid as immigrant students begin to put down roots in their new community, but maintain—and sustain—ties to diasporic communities. Indeed, immigrant students often bridge disparate communities, not just "home" and school, but multiple homes and distant families, some of which may be in crisis. Dubois' concept of "double consciousness" (1903) is exponentially magnified, spanning place, time, histories, and familial ties, further adding complexity, trauma, and emotionality to any notion of identity or funds of knowledge.

NUP also exhorts teachers to become active resisters of othering pedagogies, to deliberately engage in unothering. Unothering "interrupt[s] colonizing discourses by abrogating or rejecting normativity in the (mis)representation, definition, and translation" of newcomer communities, perceived as different, deficient, and damaged (Goodwin, 2010, p. 3126). NUP exposes and counters othering that targets newcomers. A simple example of a common othering practice involves naming whereby newcomer names are often anglicized, mispronounced, or made the butt of jokes. NUP not only honors correct pronunciation of names—and works hard to learn them—but ensures all the other students and teachers in the school learn the same, while also speaking out about the importance of naming (respect, history, identity, belonging) for/of every child.

NUP transforms how immigrant children are viewed by seeing them as capable and powerful, by valuing all they bring, and by meeting them where they are academically, socially, and culturally through genuine relationships of care built among all members in their learning communities (Shah, 2013). Below, we examine stories of teachers of immigrant students in Turkey and the United States (North Carolina, and New York City) and their pedagogical stances through this lens of Newcomer Unothering Pedagogies to illuminate practices that invite newcomer students into learning such that they are "not passive bystanders ... but active participants" (Moll et al., 1992, p. 134), empowered to resist "the alienated condition of contemporary life" (Lave, 1991, p. 65) that seeks to discount them.

Stories and studies of teachers of immigrant and refugee students: the case of Turkey

Turkey, Syria's neighbor between Europe and Asia, has facilitated an open-door policy for refugees and asylum seekers (İçduygu, 2015), granting them legal "temporary protection" status (Kirişçi, 2014). However, as conditions continue to deteriorate and the number of arrivals increase tremendously, the positioning of Syrian refugees has changed from "guests" to "residents" (İçduygu, 2015; Karlı-Calamak and Kilinc, 2019; Kirişçi, 2014). Currently, Turkey hosts the largest number of refugees worldwide, almost 4.1 million, including 3.6 million Syrians and nearly 330,000 asylum-seekers and refugees of other nationalities (The UN Refugee Agency [UNHCR], 2020d). Specifically, over half of Syrian refugees are children (UNICEF, 2019). Of them, 684,919 Syrian children were enrolled in formal education as of March 2020 (UNHCR, 2020b), almost all of them in public schools (UNHCR, 2020c). Consequently, the Turkish education system is confronting massive flows of immigrant students, creating challenges for teachers and exerting pressure for policy changes to develop longer-term strategies that prioritize integration in education (İçduygu, 2015; Kirişçi, 2014).

Facing a sudden influx of refugee students: the professional needs of teachers

This study draws on journal articles published in Turkey between 2015 through 2019, a period of unprecedented global immigration (UNHCR, 2018) and the height of the refugee crisis in Syria, to offer a window into the knowledge and skills teachers need to meet the needs of immigrant students. A comprehensive search in both Turkish and English was conducted using relevant keywords, focusing on teaching and teacher education for immigrant students. To this end, 52 articles mentioning concepts related to migration, immigration, refugees, teachers, teacher candidates etc. were identified for a full read.

The 52 articles present a range of pedagogies for educating immigrant students in Turkey, along the continuum from othering to unothering practices. First, the findings from 35 articles suggested that a significant part of the pedagogies concerning the education of immigrant students involves certain instructional methods especially in bridging the language gap. Yet, most articles provided counter-examples of unothering pedagogies to teach immigrant students, rooted in a deficit-based approach. Accordingly, the most common challenges for teachers were their inability to communicate with refugee students/parents due to language barriers, their inability to provide psychological assistance to the students/parents facing depression and trauma due to the effects of war, migration, and economic difficulties (Aydin and Kaya, 2017; Aykırı, 2017; Erdem, 2017), lack of competence to employ linguistically-responsive instruction (Aydoğdu et al., 2019; Er and Bayındır, 2015), and limited access to relevant instructional materials (Biçer and Kılıç, 2017; Bulut et al., 2018). Moreover, teachers' incompetence in accommodating immigrant students' needs through relevant assessments, their inability to collaborate with parents of immigrant students (Morali, 2018; Saritaş et al., 2016), and their beliefs, dispositions, and conceptions of immigrants embedded in assimilationist perspectives (Başar et al., 2018) were among other serious issues. To illustrate, particularly highlighting language differences as a primary barrier for immigrant students to overcome, a teacher in the study by Aydin and Kaya (2017) reported that even when immigrant students are familiar with a given topic, their slow reading and comprehension puts them at a disadvantage in exams:

For example, we give exams. The student takes out his dictionary. He needs to look up the words, understand, and then answer the questions but by the time he does this the time is up. Thus, he leaves the dictionary. And answers the questions haphazardly. Then he fails. That means he needs to master Turkish first (p. 7).

Accordingly, the findings further showed that one issue related to supporting teachers to meet refugee students' needs was about the inadequacy and irrelevancy of pre-service teacher education. For instance, according to Arslangilay (2018), a newly graduated teacher candidate said "I don't have much knowledge, except that we read [about Syrian refugees] from newspapers," while another graduate highlighted the lack of relevant courses and practice-based opportunities in pre-service teacher education. On the other hand, some examples of the curricular pedagogies enacted by teachers to connect immigrant students to the curriculum included the integration of classroom materials and texts reflecting students' backgrounds and histories, employing specific second language instructional techniques (Aydoğdu et al., 2019), utilizing educational games or extracurricular activities to support immigrant students' language development, fostering language-focused instructional coaching, creating classroom interactions to support language learning (Kuzu-Jafari et al., 2018), developing professional collaboration between general education teachers and bilingual and/or immigrant teachers, fostering parent involvement (Bulut et al., 2018), and collaborating with others who can translate between Turkish and immigrant students'/parents' mother language (Aykırı, 2017). To illustrate, a teacher in the study conducted by Aykırı (2017) said:

We have been experiencing a lot of difficulties communicating with them [Syrian refugees]. Therefore, we try to communicate with parents [of Syrian refugee students] with the help of translators [other individuals at home/in school who can provide help in translation and build bridges between teachers and students/parents].

Translated by Akin-Sabuncu (p. 50).

Second, the findings from 15 articles addressed teachers' inability to extend beyond the teaching of individual learners in the classroom, to the ways in which teachers can build on what students bring to school with them, including their knowledge, interests, experiences, beliefs, and cultural and linguistic resources. Particularly, teachers struggled to adjust the curriculum and see immigrant students' transnational identities and experiences of living in multiple cultural worlds, families, communities as strengths (Başar et al., 2018; Solak and Celik, 2018; Tösten et al., 2017). The work of teachers is challenged by top-down and mandated K-12 curricula that do not directly include topics on immigrant students (Taskin and Erdemli, 2018), the pressure on teachers not to fall behind on the general curriculum (Börü and Boyacı, 2016), and lack of autonomy to implement alternative assessment and evaluation techniques in a pervasive testing culture. A teacher in the study by Börü and Boyacı (2016) remarked:

I teach this class, in which there are immigrant children, once a week. Since it is only one hour per week, I am obliged to implement the general curriculum and rush things until I finish everything. That's why I don't make any extra effort for those children.

As a result, in some cases, teachers advocated for assimilation following a top-down approach from education policies to "fix" the issues related to immigrant students. Although Başar et al. (2018) mention that there are also teachers who want to spend extra time with immigrant students in their classes, the challenges faced by teachers mostly result in their inability to educate immigrant students. Therefore, those students usually feel isolated in the class and lag behind their non-immigrant peers.

The remaining 2 articles offered little evidence for concrete steps for preparing teachers to privilege immigrant students' specific needs and making curriculum more culturally relevant (Zayimoğlu-Öztürk, 2018), or shift and develop thinking about immigrant students so that teachers would be able to face their own prejudices and change their perspectives (Gögebakan-Yıldız and Engin, 2019).

Key learnings emerging from the findings

The findings portray that Turkish teachers' current practices are not serving the needs of immigrants adequately and offer implications for pre-service and in-service teacher education to meet immigrant students' needs. Teachers feel unprepared and lack professional support to teach immigrant students and thereby, tend not to value their identities and backgrounds as a resource or strength to build on in the mainstream education context to accommodate their needs. Yet, this leads to the misrecognition of immigrant students' cultural and linguistic diversity in the classroom and perpetuates their position as passive and invisible "others," whose voices are not often heard or, at the best, lag behind their nonimmigrant peers. These problems are only aggravated when teachers are challenged by the unavailability of educational and economic resources and the presence of structural obstacles, political and social discourses in teaching immigrant students. Thus, given the expectation that classrooms of the future will be even more diverse, the findings call for pre-service and in-service teacher education to provide equal educational opportunities and employ pedagogies that would include immigrant students within the classroom and advocate against their marginalization and othering. To this end, teacher education needs to acknowledge that immigrant students bring a range of diverse cultures and experiences and thereby, must ensure that teachers develop various strategies to educate immigrants holistically by embracing their feelings, family, and community ties. The findings further signify that the education of a large number of immigrants, as in Turkey, requires systematic and organized collaboration among stakeholders to, first, bring in critical conversations about the educational needs of immigrant students to help teachers develop new perspectives. Thus, it is imperative to promote dialog, transformative actions for change, and shared responsibilities within and across state borders in today's global world to collectively dismantle unjust anti-immigrant practices and build on practices that are aligned with the tenets of social justice (Karsli-Calamak and Kilinc, 2019). Lastly, while Turkey's open-door policy has been universally appreciated, some criticisms have also been raised due to the legal uncertainties and administrative drawbacks; therefore, as Turkey does not have unlimited resources to accept and support further refugee flows (İçduygu, 2015), both Turkey and the international community should reevaluate their educational policies, including teacher education policy, utilizing a long-term perspective. To this end, they should consider immigrants' and refugees' protracted displacement and the likelihood of further arrivals and prioritize the educational policies for their integration while preparing for further refugee flows.

"Girl, you're smart": the story of one Latinx immigrant community-based educator's lived experiences

Unothering pedagogies are essential for formal schooling spaces in the United States as teachers rapidly pivot to meet the needs of growing numbers of immigrant students. Particularly, in the past decade, Latinx immigrants have represented a sizable portion of immigrants not just in the United States, but globally (Noe-Bustamante and Lopez, 2019). However, while schools are developing new pedagogies to teach immigrant students, immigrant educators in community-based organizations (CBOs) have long employed unothering practices within Latinx immigrant populations, such as centering Latinx students' lived histories and needs in education-based spaces. Specifically, Latinx immigrant community-based educators draw on their own immigration experiences and familial and community ties to inform how they engage and relate to immigrant students.

Lucia's case

The case of Lucia, a Latina community-based educator, elucidates what it means to teach immigrant students. The research summary draws from a 3-year in-depth study of 4 Latinx immigrant youth educators who work with adolescent Latinx immigrants in a CBO called Juntos NC² in North Carolina. Juntos NC works to unite community partners to provide Latinx 8–12th grade students and parents with the knowledge, skills, and resources needed for high school and college preparation. The data in this summary draw from Lucia's semi-structured interview, her published writing with Juntos NC students, and observations of her community-based work in Juntos NC. This research summary asks, "How do Lucia's lived experiences inform her educational community-based practices with immigrant students?"

"Girl, you're smart": cultivating and affirming assets of Latinx students

Lucia's case is one in which an immigrant educator's lived experiences informed how she centered immigrant students' lived histories and funds of knowledge. As a Mexican immigrant and a first-generation college graduate, Lucia's role as program director at Juntos NC was to create community and provide resources for Latinx high school students to belong, to succeed

²The study received institutional review approval to unblind the organization's name to honor the work of community-based staff. Lucia is a pseudonym.

academically, and to prepare for college-career readiness. Lucia's lived experiences of what she called "smartness" informed the ways in which she drew upon the assets of Latinx immigrant students. In her semi-structured interview, she told the story of her experiences as a high school student: "Honestly, I didn't really think that I would ever make it to college because I didn't think I was smart enough."

Lucia explained that she did not think she was "smart," because some teachers' expectations of Latinx students in her school were that they cannot go to college. Specifically, she remembered that teachers' impressions were either Latinx students were "not going to go" or "cannot go" to college. There were teachers who had not had much "experience working with [Latinx students]" and therefore did not "understand our culture." She also attributed a lack of understanding when it came to reading and writing. Lucia mentioned that as an ESL student, she really "struggled with writing and reading skills and in English." Even as Lucia improved, she lacked confidence in her literacy skills. This dearth of her teachers' understanding and ability to teach and encourage Latinx students who were ESL learners led her to believe that she was not "smart enough" for college. It was not until college that she began to realize, "Girl, you're smart."

Informing her practices

Lucia wishes that Latinx students could say, "you're smart" to themselves early on in high school. One way to do this is to build the confidence and assets of Latinx students. She modeled confidence building through cultivating the "smartness" in Juntos students by organizing and partnering with programs such as a literacy project that celebrated and developed students' voices and writing. Because she was "othered" by teachers as "not college ready," she used her own experiences to build bridges for teachers. For example, she traveled to high schools to host workshops for administrators and teachers about the assets of Latinx students. She regularly built relationships with school staff and community partners to develop valuable resources such as family nights, summer camps, and curriculum that informed Latinx students and parents about access to school resources and higher education. She has now made it her mission to cultivate, celebrate, and promote Latinx students' assets so that they could be "unothered" in formal schooling and moved from the margins of schooling spaces where she was once was.

"I am the first out of my family to go to college": using lived histories to prepare Latinx immigrant students for college and career readiness

Secondly, Lucia cultivated these assets because community educators had once cultivated hers. As the youngest of eight siblings, Lucia was the first to leave home and attend higher education: "Growing up, my parents did not understand the educational system ... I struggled the most when it came to the college process because I was not aware of the process." However, Lucia's trajectory changed when as a high school student, she connected with El Pueblo, a leadership development organization for both Latinx youth and adults. She went on a college tour to North Carolina State University (NC State) with El Pueblo and remembered seeing all the students and thinking, "Gosh, I'm just not smart. Honestly I thought college was not something that I could do and I wasn't smart enough to do it." However, after the tour, El Pueblo provided her with a mentor who helped her with the college admission process.

To her surprise, she got in. With a full ride. She was "shocked" and it felt "very surreal," but she still felt she was not "smart enough" and she was "not going to be smart enough." Lucia reflects on her experience by saying that "a lot of the students that I've worked with are in the same situation where they doubt themselves." Her reflection further emphasizes the need for teachers to encourage students and for community organizations to partner with students to provide them with the resources needed to pursue higher education.

Yet, Lucia's acceptance also came with hardships and her experience taught her that community-based educators must recognize the tensions of preparing students for college readiness. Though her admittance to NC State was filled with personal joy, her family felt that it was "almost like a hit to the heart; they just felt like I was betraying them because I was leaving." For her, the hidden curriculum of the college-going process was not only unknown to her, but in conflict with her parents' values and cultural strengths that were founded on familial ties. She worked through school to support her family while also building a career for herself, and over time, she was able to demonstrate to her family what her college education meant to her.

Informing her practices

Because a local community organization was able to bridge the gaps for Lucia to attend college, Lucia's experience motivated her to work in community organizations to help provide the resources and access to college for both Latinx students *and* their parents. Furthermore, her own college-going experience informed how she approached Latinx students *and* their families when preparing them for college-career readiness. Because she understood the cultural strengths and also the hesitations of college preparation, she was able to reach both families and students simultaneously to talk about the college-going process in culturally responsive ways. She unveiled the hidden curriculum of the college-going process by centering students' immigrant experiences and family values when discussing students' futures. Her approach reflects the culturally responsive practices that community educators and teachers must take to provide the resources "for them [students and parents] to understand the college process and to tell the students that [they] too can do it."

Key learnings of Lucia's lived experiences

Lucia's case is just one of many Latinx immigrant community-based educators like the three other stories within the larger study. Many, like Lucia, reflected on the power of knowing, believing, and hearing that they belonged. The importance of belonging—a central tenet of NUP—spoke to the necessity of “unothering” Latinx immigrant students. However, Lucia's lived experience as a Latinx immigrant student is profoundly impactful to her role as a program director who helps students and their families with the resources to be academically successful.

The deep look into Lucia's case demonstrates that immigrant teachers' lived experiences possess rich knowledge and experiences that influence how they perceive and enact educational practices (Goodwin and Kosnik, 2013). Lucia's case is particularly unique as she offers “funds of power” (Adair et al., 2012, p. 25) that can impact the assets of community-based organizations that support schooling institutions. Her unothering methods included (1) cultivating assets that honored and respected the multiple identities and voices of Latinx students, and (2) drawing upon her lived histories to be culturally responsive to her students' college-career readiness. Her experiences inform educators of the importance of being culturally responsive within classrooms, and even *within* communities. In doing so, immigrant stories from immigrant community educators have the power to humanize and to *unother* immigrant students' lives.

From newcomers to welcomers: immigrant teachers in New York City

New York City (NYC) is known as a destination city for many newcomer immigrants for centuries. Now, the city hosts newcomers mostly from Asia, and South and Central America, accounting for 44% of the entire city population, that includes 3 million immigrants in total (NYC Mayor's Office of Immigrant Affairs, 2020). Schools in NYC, thus, have a long history of educating immigrant children, boasting their diversities in their school profiles. More than half of the student demographic are either immigrants or children of immigrants who bring over 150 languages other than English to their learning environments (New York City Department of Education, n.d) with complex immigration histories and funds of knowledge. In responding to these incredible diversities, the presence of teachers who are culturally congruent and understand the multilayered contexts of immigrant students is crucial. However, little is known about teachers, who can be considered as “culturally-located insiders” (Goodwin, 2010, p. 3122), particularly those themselves who are immigrants.

In this research summary, immigrant teachers and their lived experiences are highlighted on issues around immigration and schooling. The following research questions are asked: What unique experiences do immigrant teachers bring to the education of immigrant students? How do their cultural, linguistic, and experiential competence shape their pedagogical approaches? In what follows, vignettes of three immigrant teachers³ are presented. Drawn from interviews and classroom observations, their stories illuminate the complexities and contradictions in their lives, meshed with their own immigration histories and schooling as newcomers and with their teaching of immigrant students as welcomers.

Choosing to be silent

Tuyet Nhi who immigrated with her parents from Vietnam described her initial feelings of being othered as a newcomer, “I was lonely, very lonely... and scared.” She shared how traumatic it was to be an immigrant child and learn the vulnerability of her parents in the foreign land. She mentioned witnessing her mother asking to change her grade level due to the interruption in her schooling but being completely ignored by school personnel. Since then and for a long time, Tuyet Nhi did not speak in school because she did not want to “bother [her] teachers” or perhaps she was afraid of being ignored by them.

Now entering her seventh year as a teacher of mostly Chinese immigrant children, she instinctively and intentionally uses pedagogical approaches of unothering. To prevent the perpetuation of harmful practices she once experienced as a newcomer, she pays extra attention to those who stay quiet and makes safe spaces to hear their interests and needs in both Chinese, “Chinglish (mix of Chinese and English),” and English. Tuyet Nhi stated that one of her teaching goals is to take bold and nontraditional actions to create a learning condition where immigrant children can be themselves for who they are and thrive while “having fun” in their schooling journey.

Becoming “one of them”

Al had layered immigration histories moving from Argentina to Israel as a child and then from Israel to the US as an adult. As an immigrant child in Israel, his way of survival was to become “more Israeli than Israelis.” He wanted to become “one of them” and to be accepted by his peers because he wanted to belong. Unlike his first immigration history, when he moved to NYC he struggled tremendously with not only his English language learning, but also deeper emotional issues, feeling as though he was “crippled.”

In his current classroom, he found his new sense of belonging, redefining his identity as a teacher of immigrant children. Using his immigration histories as a foundation to his pedagogy, he brings multimodal ways of learning, including music, arts, and film to provide multiple entry points to curriculum, enabling students who are new to the English dominant environment to express

³Tuyet Nhi, Al, and Gianna.

themselves through various modes of communication. Al emphasized that the core of working with immigrant students is to be able to “listen” to their funds of knowledge, to see them as “souls,” and to co-create an inclusive curriculum of unothering where belonging is a natural, fundamental part of their learning community.

Othered but empowered to unother

The struggle with learning a new language and not belonging were echoed by Gianna who had immigrated from the Dominican Republic as a mother to provide better living environments for her children. The transition was not an easy one. Her husband, who was an architect in the DR, became a taxi driver. Gianna also had to hold multiple jobs such as a gym locker room attendant and a maid to make ends meet. Later while working as an assistant teacher in her children’s school, she had an opportunity to attend graduate school to advance her career as a teacher. However, attending a university as a nontraditional immigrant woman came with many othering experiences. In addition to her language difference, she shared the many times she felt othered by professors who questioned her presence in the university. Yet, having worked in the classroom for many years already she was empowered to shine her strengths in her practicum courses by demonstrating her excellence in working with immigrant children and their families.

Gianna spoke about partnering with parents, who are low-income immigrants, and how they “repeat[ed] [her] stories.” She said, “Working with [immigrant] parents is my specialty” and noted that although they seem to be absent in their children’s education, they are involved in their education “at another level.” Reminiscing her early years as a newcomer working in multiple jobs to provide for her children, she confidently stated even though immigrant parents might not be able to “show up” to school events in traditional ways, they deeply care for their children’s education. And “the children know.”

Key learnings

In response to relatively little research on immigrant teachers, this research summary illustrated brief accounts of three immigrant teachers who were once newcomer immigrants and the ways in which their immigration and schooling stories shape their teaching of immigrant students. Privileging the voices of immigrant teachers this way enables us to see a glimpse of the complexity within their lives both as newcomer immigrants as well as teachers of immigrant students, bearing valuable insights into how schooling operates for and against immigrants (Elbaz-Luwisch, 2007b). It also provides a window into their teaching as compassionate welcomers of newcomer immigrant students and their families. Studying the lives of the immigrant teachers helps us understand their work from their own immigration and schooling histories, which laid the foundation for enacting a pedagogy that promotes inclusion, belongingness, and community for their immigrant students (Elbaz-Luwisch, 2007a,b).

In particular, the narratives of the immigrant teachers in this study made visible the nuances in teaching immigrant students. Entangled with their negotiation of identities and languages as well as the oppressive practices against immigrants in schooling, the three immigrant teachers teach us lessons in which understanding firsthand the experiences of immigrant students requires holistic and comprehensive views on who they are, their strengths as well as vulnerabilities. That is, teachers need to acknowledge and genuinely value immigrant students’ complex identities and their rich funds of knowledge, to assume them to be passionate knowers who are interested in learning and growing, and to consider their lived realities into curriculum in multiple and meaningful ways. Tuyet Nhi, for instance, demonstrated her pedagogical approaches by listening to her students through translanguaging practices. Al intentionally provided multiple ways for his students to express their learning and to co-create curriculum. For Gianna, teaching immigrant students went beyond the students themselves by respecting their families and valuing their nontraditional ways of being present in their children’s education. In doing so, the teachers were able to break the chain of the oppressive and exclusionary practices that have traditionally inhibited immigrant students from accessing inclusive and quality education (Goodwin, 2017). Rooted in their lived experiences of inclusion and exclusion and the trauma associated with being othered as newcomer immigrants, the teachers showed a strong desire to engage in undoing the othering processes by honoring students’ various language repertoires, creating learning conditions for them to be active knowledge contributors, and assuming the good in their families no matter how they appear to be superficially.

The method of inquiring into immigrant teachers’ lives offers important implications for teacher education for immigrant education. Adult learners like Gianna possess rich personal knowledge shaped by their own histories and narratives that influence how they perceive and enact teaching (Goodwin and Kosnik, 2013). Instead of rejecting their knowledge, teacher educators can employ autobiographical analysis (Genor and Goodwin, 2005) to incorporate their stories into teacher education curricula because their stories have value and are worth listening to, which in turn can inform teacher education about important social and political issues regarding immigration and schooling (Goodwin, 1997). Immigrant stories have the power to transform “the Curriculum of othering” (Goodwin, 2010, p. 3124) into the Curriculum of *unothering* in teacher education for the education of immigrants as a site of resistance and possibilities.

Discussion

The three cases we have presented each focuses on the education of immigrant students within a particular context. Turkey offers a macro view of a system overwhelmed by the sudden influx of large numbers of refugees who quickly re-position from temporary guest to more permanent resident. These “residents” bring with them thousands of school-aged children who require teachers to

educate them. NC and NYC both provide a more intimate look through the experience of teachers who are also immigrants—what unique knowledge do they hold about educating immigrant students given their insider perspective, either from within the formal educational system (NYC) or from outside it as community-based educators (NC)?

Our conceptualization of Newcomer Unothering Pedagogy provides an analytic lens for a cross-site analysis of immigrant student education across the three cases, enabling common themes and issues to come to the surface, but framed by a specific socio-political and country context. NUP centers on three tenets: (a) *360 degree belonging* that recognizes belonging as necessarily multi-dimensional and all-encompassing as newcomers add, shed, and transform identities as they move between realities; (b) *trans-culturally relevant pedagogy* that is culturally grounded but respects numerous and simultaneous transnational lived experiences across socio-historical and global boundaries; and (c) *active unothering* that names and combats any practice or policy designed to explicitly and implicitly marginalize and otherize immigrant students, and counters othering through deliberate unothering actions.

360 degree belonging

Engendering belonging for immigrant students requires fully comprehending their extent of loss—of the familiar, of home, of identity, of financial stability, of cultural comforts, of language and communication. Each of us wants to be able to stand out for reasons beyond our strangeness, as well as to be able to blend in with the everyday and with everyone. Belonging is a two-way process in which local inhabitants must be as prepared as newcomers to shift positions and make compromises, to bend and flexibly open up spaces so that *different* can find a niche, a comfortable space to enter, even as *typical* finds themselves transformed by their embrace of new.

Turkey tells a story of belonging where the two-way mutual process is still emerging, as newcomers continue to be expected to do the hard work of adapting and changing so as to become more like local residents and therefore less strange. Language difference is the key marker of (not) belonging, and governs whether teachers (can or choose to) communicate with students and their families, include immigrant children in the curriculum, and adapt instruction to ease their entry into Turkish schools. Ensuring Turkish teachers are able to engage NUP of belonging requires changes in teacher preparation, professional development and teacher education policy designed to enable those on the inside to see themselves as accountable for solving the “problem” of immigrant education. NC tells the story of learning from educators outside the formal educational system who have wider experience with NUP given their charge to build bridges of belonging for immigrant students using their lived experiences and cultural histories. As immigrants themselves with close ties to newcomer communities, their emic understanding of what it means—and what is needed—to create pathways for immigrant students to traverse the space from outsiders to a deep sense of belonging, is invaluable. However, the separations between school and *not*-school are wide, and the NC case urges us to embrace the wisdom already available in communities; community-based educators and families who hold funds of knowledge are waiting to be tapped and offer rich tools for bridge building. School insiders such as the immigrant teachers in the NYC case, also own rich funds of knowledge and are ready to be tapped. But they too remain invisible in plain sight. The NYC immigrant teachers’ practice is integrally informed by their personal stories of exclusion and each constructs their NUP of belonging from their own experiences, using their practice to counter contemporary othering that they also faced in their past as newcomers. Their stories reveal the complexity of exclusion, that marginalization is multi-layered and ongoing and the consequence of numerous actions, events, oversights that gain momentum over time. Thus NUP of belonging must be fully embracing so as to fully address 360 degrees of students’ lived experiences.

Trans-culturally relevant pedagogy

Identity and culture are never static, but fluid and ever-changing, states of being and thinking that, when privileged and honored, have the power to ignite and personalize learning, thus empowering disenfranchized learners (cf. Gay, 2018; Ladson-Billings, 1994; Pang, 2018). Who we are is shaped by our histories, familial ties, cultural roots, and when these are excluded from the formal curriculum, then our very spirit and essence is—we are—erased from the curriculum. The basic principles of culturally relevant pedagogy (CRP, Ladson-Billings, 1995) are salient in trans-culturally relevant pedagogy (TRP) with one significant difference: that the histories, familial ties, cultural roots, etc. of immigrant students are not just many and complex (as they are with each individual), but are further complicated and texturized by the simultaneous existence and influence, of inter-national, geo-political realities that are (sometimes viscerally) experienced in parallel in the lives of newcomers and embodied and enacted in their every day. TRP is, to put it simplistically, many-dimensional CRP.

Newcomer TRP requires this multi-dimensional understanding of “culture” even as it begins with coming to know newcomers as an imperative—and seeing them not just as different, but as worthwhile knowing. The case of Turkey demonstrates the need for preservice preparation and in-service PD to develop this understanding around knowing as a precursor to NUP through TRP, since the assimilationist stance remains apparent. But research reveals movement in this direction as teachers awaken to notions of teaching from the perspective of refugee children, vs. from the perspective of the state, set curriculum, or their own needs. Lucia in NC and the immigrant NYC teachers illuminate, through their stories, how country displacement, even by choice, results in adults/parents and their children walking the tightrope of who they were in “the old country”—educated, appropriately employed, facile communicators—and who they are forced to become in the new—students/children all over again as they relearn the basics and depend on their children to guide them, under-employed, often in menial jobs, silenced. TRP as one practice of NUP acknowledges and responds to the tension between identities that are trans-nationally located and span (often conflicting) socio-political boundaries, and how that tension affects agency, well-being and learning.

Active unothering

Active Unothering represents the DNA of NUP, because when teachers are able to see and interrupt unothering, they are able to enact the other essential tenets of NUP for immigrant students. Active Unothering requires the ability to see and unsee (Lewis, 2012), discern hidden realities that bring the wholeness, the “soul” of *Other* to the surface and in so doing resisting and rejecting the marginalizing identities they are assigned. Active Unothering is exemplified by Lucia’s insistence on unwrapping the mysteries of college admission to immigrant students, breaking through the pathologies that surround them and cause them to doubt their abilities; it is enacted in the “bold and non-traditional actions” Tuyet Nhi takes to ensure her immigrant students can “be themselves”; it is evident in general and ESL teachers in Turkey reaching out to one another to learn together about how to take positive action on behalf of their refugee students.

Conclusion

The “drastic increase in the number of immigrants ... caught many nations by surprise and left teachers poorly prepared for the changed composition of their classes” (Paine et al., 2016, p. 743; cf. European Commission, 2013; OECD, 2019). Educating teachers to successfully meet the needs of immigrant students in a world on the move is an imperative that cannot be ignored; the recent Afghanistan and Ukrainian crises heighten the issue. Teacher preparation must be designed to equalize educational opportunities and intervene in immigrant children’s “marginalization, denigration, segregation, and denial of competence” (Liu and Ball, 2019, p. 71). The three cases of immigrant students and teachers underscore the uniqueness of newcomer stories given differences associated with place, time, culture and immigrant histories, at the same time that these stories hold shared meanings across contexts. The US cases reveal the power of autobiography, that immigrant students’ lived experiences can become pathways into relationships, learning and belonging, especially when the teachers who nurture them can reach into their own newcomer stories to help create connections of-for knowing. The three cases together illustrate the complexity of the immigrant experience which in turn inform the nature and nuance of teacher preparation in response to specific needs. These cases are complementary, but are not comprehensive, and offer concrete enactments of Newcomer Unothering Pedagogies that take teacher preparation from understanding to action.

Introduction

The idea of teacher education for social justice, or social justice-oriented teacher preparation, is common in both research literature and in program narratives across the globe. However, this has long been criticized as something so ill-defined that it is difficult to move beyond rhetoric and into reality. Cochran-Smith (2010) argues that “few who write about teacher education and social justice make the underpinning political and philosophical roots explicit, and that this increases the likelihood that it [social justice] exists in name only or that it is diluted, trivialized or co-opted” (p. 445). In this article, I want to propose that “socially progressive teacher education” might hold promise as an alternative, wider framing that is defensible conceptually and also capable of being applied in practice. My interest in seeking to conceptualize socially progressive teacher education is located ethically in my experience as what I would term a social justice educator, and practically in my current role as Director of Teacher Education within a university which promises “a relentless commitment to pursuing a globally socially progressive vision” (University of Strathclyde, 2020, p. 6).

Just as my own university has made its underpinning philosophy explicit, so too argues Darling-Hammond (2006), do what she calls “powerful teacher education programs, defined as:

Programs that prepare teachers to teach a wide range of students successfully, including those who struggle to learn from their first days in the classroom. These are programs whose graduates are sought out by principals and superintendents because they prove consistently capable of creating successful classrooms and helping lead to lead successful schools, even in circumstances where the deck is traditionally stacked against student success” (p. 27).

Here, “powerful” has a particular meaning: it is not simply powerful in terms of having capacity to influence, rather, that influence is specifically located in terms of a social justice agenda. So while “effective” teacher education programs might beg the question “effective at what?”, Darling-Hammond’s notion of powerful programs makes explicit the philosophical underpinning of the way she understands “powerful”, from a critical theory perspective. In the same vein, I draw on a range of research in seeking to make explicit the theoretical and philosophical underpinnings of socially progressive teacher education, while at the same time illuminating what this might look like in practice.

In striving to make philosophical underpinnings explicit, the article outlines three distinct, but linked ideas that influence how socially progressive teacher education might be understood and practiced: social progressivism as a political ideology; pedagogical progressivism as an educational movement; and social and environmental justice as ethical imperatives. The argument is founded on an acknowledgment that education in general, and teacher education in particular, cannot ever be neutral, despite some claims to the contrary.

Conceptualizing socially progressive teacher education

Like many terms in education, “socially progressive teacher education” may well mean different things to different people; it is not easy to define, just as social justice-oriented teacher education is similarly “undertheorized and vague” (Cochran-Smith et al., 2009, p. 347). The appeal to “progress”, however, is undoubtedly a persuasive one, yet progress is always a value-bound process, and one person’s progress may well be another’s idea of deterioration. I therefore want to draw on existing definitions of the three linked ideas mentioned above, as well as foregrounding issues of values, in exploring how the concept of socially progressive teacher education might serve to frame the development and delivery of ethically sound, contemporary teacher education programs.

It seems that there are three broad ideas which coalesce around the concept of socially progressive teacher education, namely, social progressivism as a political movement, pedagogical progressivism as an educational movement, and social and environmental justice as ethical imperatives (Fig. 1)

Fig. 1 Conceptualizing socially progressive teacher education—three overlapping ideas.

These three ideas loom large in any discussion of socially progressive teacher education, yet in many respects they stand quite separate from each other. In this **Introduction** section I want to outline how each idea individually can inform thinking about socially progressive teacher education, before exploring how the three ideas might interact.

Social progressivism as a political movement

Social progressivism is commonly considered to be a political philosophy which supports social reform for the good of society at large (as opposed to for particular groups or individuals). The “social” part of social progressivism acknowledges that change over time should be to the benefit of society, rather than simply change for change’s sake. The “progressivism” part connotes an acknowledgment that change is necessary in order to achieve social good, and that, therefore, reform is key to progressivism. This stands in opposition to social conservatism which relies on the status quo as a means of preserving what are deemed to be traditional social values.

Social progressivism rejects appeals to tradition and status quo, arguing that society should change and develop as new knowledge and understanding become available. The particular focus of socially progressive reform is in exposing root cause of things that are deemed to make aspects of society less than fair, and then to push through reform that will work against these identified barriers. There is, therefore, an innate commitment to what might be called social justice. However, it is not a radical or critical approach to social injustice as might be advocated by social justice proponents, rather, social justice is a driving force for incremental reform; it serves as a compass for decision-making.

Social progressivism does not locate its interest in any one particular cause, rather, it is about moving toward reform in a range of areas, with the common theme being that of improvements in society through challenging out-moded attitudes and practices particularly in relation to gender, race identity and power. Crucially, to be socially progressive means to be able to develop and change one’s own attitudes over time in light of new knowledge. This has clear implications for teacher education: it acknowledges explicitly the impossibility of an initial teacher education experience which could prepare a teacher for their whole career. Instead, it suggests an initial teacher education experience which prepares a teacher to be a career-long professional learner. Logically, then, it follows that part of socially progressive initial teacher education must be about supporting teacher candidates to be able to know how to continue their own learning, and to make autonomous choices about what and when to learn. This stands in direct contrast to what [Freire \(1970\)](#) calls the “banking model of education”, where the teacher “deposits” knowledge into the student, thereby rendering the student agency-less “in which the scope of action allowed to the students extends only as far as receiving, filling, and sorting the deposits” (p. 72). So, socially progressive teacher education requires a range of different types of knowledge, and the requisite skills of critical analysis and synthesis in order to make judicious choices about the rigor and appropriateness of what might be presented as “knowledge”.

While social progressivism relies on reform based on new knowledge, there is an inherent danger that such new knowledge, or evidence, might be adopted uncritically. For example, the current focus on “what works”, particularly prominent in England, with the concomitant growth in the promotion of randomized controlled trials (RCTs) runs the risk of only certain types of new knowledge being deemed reliable. While there remains considerable debate to be had about the relative merits of RCTs over other more qualitative research ([Connelly et al., 2018](#)), the fact remains that “knowledge” itself is not neutral, nor equally rigorous and reliable in its creation, and that socially progressive teacher education needs to support pre-service teachers to develop strong research literacy, particularly as consumers of research.

Key to social progressivism is that new insights should lead to structural and cultural reform that supports a fairer society: it is not sufficient simply to know that things might not be working in everyone’s interests, or that certain groups are

disadvantaged by particular practices, rather this new knowledge should lead to reform. Thinking about this in terms of teacher education it is possible to see how reform to the structures and governance of professional regulation might be used to work for the common good. However, governance of teacher education, which in Scotland is shared by the Scottish Government, the university sector and the General Teaching Council for Scotland (GTCS), is notoriously bureaucratic and conservative (Hulme and Kennedy, 2016). The homogenous nature of teacher education programs, all of which are university-based, and all of which are accredited by the GTCS following a fairly prescriptive set of criteria (GTCS, 2019a,b), means that responding to new knowledge or insights and amending programs accordingly is very difficult, except in relation to minor tweaks. While the existence of these sets of governance procedures arguably serves to maintain teacher education quality in Scotland (Hamilton, 2018), it can also result in teacher education programs having to make significant compromises in order to satisfy particular rules (Kennedy, 2018).

While Scotland's teacher education is governed centrally and is university-led (MacDonald and Rae, 2018), in other countries, for example nearby England, there is much more of an appeal to market-led governance and school-led initial teacher education. Mincu and Davies (2021) argue that the system in England is governed by a complex interaction of markets, networks and hierarchies, but these national systems of governance do not work in vacuums; it is important to recognize the increasingly powerful influence of global politics on national systems. For example, Cobb and Couch (2018) argue that the OECD's move to assessing "global competence" in PISA has had a significant impact on initial teacher education, serving to provide what they call "global pedagogic governance" (p. 41). What Cobb & Couch (Cobb and Couch, 2018) go on to propose is that pre-service teachers should be exposed to thinking about globalization, and how broader influences impact on schooling, and indeed on teacher education. This knowledge and understanding, they argue, "can provide pre-service teachers with the capacity to identify, and the ability to resist and transform, changes to education policy, structures and curricula" (p. 43). Thus, it seems fair to suggest that the centrality of a critical appreciation of new knowledge that is bound up with social progressivism, arguably requires teacher education students to develop skills of critical consumption of research together with an appreciation of the world beyond their immediate domain.

In summarizing the relationship between social progressivism as a political ideology, and socially progressive teacher education, there seem to be a number of key messages:

- The ultimate aim of social progressivism is to facilitate a fairer and more equal society;
- Our understanding of the barriers to achieving this aim, and the potential solutions at our disposal, develop over time, and therefore new knowledge and insights are central to driving socially progressive action;
- This focus on action is enacted through progressive and incremental reform which does not give time to sentimental appeal to tradition;
- In order to understand the potential contribution of new understanding to reform in teaching and teacher education, both teacher educators and pre-service teachers must develop their skills in critical literacy, particularly pertaining to the consumption of research;
- Socially progressive teacher education programs should eschew the "banking" notion of education and instead seek to empower teacher candidates as lifelong professional learners.

Pedagogical progressivism as an educational movement

It seems natural when confronted with the term socially progressive teacher education to think about the educational movement called "progressivism". In this **Introduction** section I want to explore how some of the key tenets of pedagogical progressivism might help us to define socially progressive teacher education, but also consider perhaps where some of the challenges might be in terms of mapping these two ideas on top of each other.

It is important, first, to be clear about what pedagogical progressivism is Labree (2005), writing from a US perspective, distinguishes usefully between what he terms "administrative progressivism", that is, the reform of structures and organization, and "pedagogical progressivism". He summarizes pedagogical progressivism succinctly, saying that "In the shorthand of educational jargon this adds up to 'child-centered instruction', 'discovery learning' and 'learning how to learn' (Labree, 2005, p. 277)." These elements, which draw deeply on the work of John Dewey, will be very familiar to educators in Scotland (and elsewhere), being the philosophical tenets of the current iteration of curriculum in Scotland (Thorburn, 2017). However, these ideas tend to be applied to the education of school pupils, rather than of teachers, or other professionals, perhaps due to the prescriptive nature of governance associated with professional education, as discussed earlier.

We might also wish to consider the extent to which pedagogical progressivism actually exists in practice, as opposed to merely in policy or academic texts. For example, Labree (2005) contends that while pedagogical progressivism might dominate education discourse in the US, it has yet to make significant impact on the classroom:

Instruction in American schools is overwhelmingly teacher-centered; classroom management is the teacher's top priority; traditional school subjects dominate the curriculum; textbooks and teacher talk are the primary means of delivering this curriculum; learning consists of recalling what texts and teachers say; and tests measure how much of this students have learned. (p. 278)

This issue of differences between rhetoric and reality are not, however, confined to the US. Some time ago, [Hartley \(1987\)](#) provided an articulate analysis of some of the reasons why progressive, child-centered curriculum policies of the 60s and 80s were never fully enacted in Scotland, citing as one reason, the economic imperatives which held dear to more traditional knowledge-focused understandings of children's learning. Similar to [Labree \(2005\)](#), [Hartley \(1987\)](#) too points to research which suggested that "the backlash against progressivism was largely misplaced: the schools had, throughout the period, remained places where didactic pedagogy had prevailed" ([Hartley, 1987](#), p. 119). [Hartley \(1987\)](#) went on to argue that progressivism requires a particular cultural and economic climate in order to thrive. It is therefore not enough for educationists to believe that progressive ideals provide the best way for children and young people to learn; educational philosophies and approaches do not exist in a vacuum and their successful integration into practice requires a favorable wider social, economic and, importantly, political context.

There are many critiques of the extent to which the discourse of pedagogical progressivism can be translated into practice, but there are also more fundamental philosophical critiques over its desirability. Such critiques center on the debate between valuing educational process over product, the role and the place of subject or disciplinary knowledge in education vis-à-vis interdisciplinary or place-based approaches ([Webber and Miller, 2016](#)). These arguments, while usually situated within the school education context, can also be applied to teacher education.

Concerning the argument that the progressivist emphasis on skills fails to value disciplinary knowledge, [Ashman \(2017\)](#) argues that there is little evidence that generic capacities to solve problems can be applied in all contexts, rather he argues that "the same person can think critically about an area where she possesses expertise and yet fail to think critically in an area where she lacks expertise" (no page number). This leads us to consider the merits of interdisciplinary learning, defined as integrating "knowledge derived from different disciplines to construct new perspectives on a particular problem or scenario" ([Stentoft, 2017](#), p. 53). Disciplinary knowledge is important in this context, and [Stentoft \(2017, p. 53\)](#) argues that the integration of disciplinary knowledge "may lead to new disciplinary insights". So, rather than watering down disciplinary knowledge, an interdisciplinary approach not only relies on discrete disciplinary knowledge but also has the capacity to elevate it to new heights. It seems reasonable to argue then that the potential criticism of pedagogical progressivism undervaluing disciplinary knowledge is not a well-founded position where a balance of disciplinary and interdisciplinary can be achieved.

There have also been concerns raised over the potential for the learner-centered nature of progressive education, with its emphasis on self-directed learning, to result in an over-emphasis on the individual at the expense of the collective, thereby failing to live up to its emancipatory promise ([Servant-Miklos and Noordegraaf-Eelens, 2019](#)). However, pedagogical progressivism is not always entirely positioned as an individualistic philosophy, and its emphasis on problem-solving in context suggests a need to work collaboratively with others. However, when juxtaposed alongside socially progressive political ideology and a concomitant emphasis on social and environmental justice, the focus on self-directed learning can be seen within the wider social context as opposed to something that is entirely individualistic and insular. Indeed, when seen as part of this three-pronged conceptualization, it seems that pedagogical progressivism has much to offer in terms of guiding a pedagogical approach that fits with socially progressive teacher education.

Social and environmental justice as ethical imperatives

If we agree that social progressivism focuses on the use of new knowledge and understanding to support reform for the purpose of social good, then there is a need to interrogate what might be meant by "social good". While it is difficult to see what arguments could be brought to bear against aspiring to do social good, the term itself is arguably rather vague, and, in common with the discussion around purposes of education, is open to multiple interpretations of what constitutes "good". Social good arguably attends to both human and environmental concerns, given that these are inextricably linked. It therefore makes sense that, notwithstanding the challenges in coming to agreed definitions and conceptualizations, social and environmental justice would feature as ethical imperatives within socially progressive teacher education.

A commitment to social justice is written into the aims of pretty much every teacher education program across the developed world, but the ambiguity of the concept increases the likelihood that it exists in the rhetoric only, and not in reality ([Cochran-Smith et al., 2009](#)). One of the difficulties here is that the term can be understood in many different ways, and this is not always fully explored and articulated across the development and delivery of teacher education programs. For example, social justice can be understood in terms of the redistribution of goods and resources, with a focus principally on economic concerns, and/or it can be understood as an issue of recognition ([Fraser, 2000](#)), which tends to focus on cognition struggles ([Benjamin and Emejulu, 2012](#)) rather than economic concerns. However, much of the conceptual work focusing on the recognition aspect of social justice tends to focus on the recognition of under-represented or minoritized groups, arguably sometimes missing the need for recognition of the individual, as highlighted by [Fleming \(2016\)](#) in his work on transformative learning theory. [Fleming \(2016, p. 6\)](#), drawing on Honneth, argues that "the struggle for recognition drives social change", thereby suggesting a link between social progressivism and the politics of recognition.

Notwithstanding the challenges in defining social justice, and articulating that conceptualization in program development, what is abundantly clear in the literature is that social justice cannot be taught effectively through discrete inputs, rather it has to permeate the program as a whole, through both on-campus and field-based elements ([Cochran-Smith et al., 2009](#)). Unfortunately, however, while research on social justice teacher education is a growing field, it has so far failed to make a significant impact on policy due to its fragmented and often small-scale nature ([Mills and Ballantyne, 2016](#)). This is of concern when we consider the earlier discussion

around the fairly inflexible and centralized governance of teacher education, and the concomitant challenges in seeking to progress social reform.

Cochran-Smith (2010) proposes that while activities in teacher preparation, such as fieldwork in diverse contexts and specific targeted readings, are important to the development of pre-service teachers' socially just practice, they are insufficient in themselves. Rather, she calls for "a coherent and intellectual approach to the preparation of teachers that acknowledges social and political contexts in which teaching, learning schooling, and ideas about justice have been located historically as well as acknowledging the tensions among competing goals" (p. 447). There is also some evidence to suggest that where programs seek to develop pre-service teachers' conceptual understanding, this work is best located within the specific classroom context for which they are preparing (Mills and Ballantyne, 2016).

As Mills and Ballantyne (2016) point out, though, much of the literature on teacher education for social justice focuses on changing the beliefs of pre-service teachers, "and 'blame' is, therefore, placed on the students for any deficiencies noted, rather than critically exploring the pedagogies and philosophies espoused by teacher educators" (p. 275). Goodwin and Darity (2019), however, argue that we need to go beyond teacher educators "espousing", and move instead to "enacting social justice in their own teaching and teacher educator practice" (p. 64). This, they argue, requires a concentrated focus on understanding what teacher educators need to know, thereby returning to fundamental underpinnings of social progressivism relating to the need to draw on knowledge in order to progress reform for social good.

Despite the plethora of writing which explicates concepts of social justice, and the smaller body of literature which interrogates social justice practice in teacher education, there somehow remains a chasm between theoretical understanding in the literature and the capacity to apply that theory systematically to practice in teacher education. Mills and Ballantyne (2016) point out that "much research in the field of social justice and teacher education focuses on an understanding of beliefs of preservice teachers and/or teacher educators, with limited exploration into what programs that prepare preservice teachers to engage with student diversity in socially just ways might look like in practice" (p. 263). While it is, of course, important to understand teachers' beliefs, this understanding needs to be put to use in terms of shaping and researching teacher education programs that make a difference. Aronson et al. (2020) contribute toward addressing this gap in understanding by identifying a number of specific theoretical perspectives that they have drawn on in their own program development work, namely: critical pedagogy; democratic education; critical race theory and critical whiteness studies; critical disability studies; and feminist theories. Importantly, they identify collectively, as a group of teacher educators, how they actually use these perspectives to inform practice; they claim to:

(1) Engage in self-reflection/praxis to promote ongoing contemplation and self-checking of personal biases and limited understandings based on our positionalities;

(2) Teach common theory vocabulary, language, and concepts throughout our courses so that students are scaffolded into higher learning;

(3) Engage theory and language into practice through assignments, projects, and outside classroom experiences;

(4) Emphasize how stereotyping and lack of critical understandings about the educational experiences of students of color can perpetuate structural inequalities in society.

Aronson et al. (2020, p. 27).

This seems to be a very helpful set of ideas for moving things forwards in a coherent way, although what is not so clear is how a group of colleagues might come to agreement about the key theoretical perspectives that they wish to base their program on. This part of the process is something that would be helpful to explore more explicitly.

Closely linked to social justice is the idea of environmental justice, another concept which evades clear and easy definition. It is defined by the US Environmental Protection Agency as "the fair treatment and meaningful involvement of all people, regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies" (<https://www.epa.gov/environmentaljustice>), while the UK-based Environmental Justice Foundation talks about "protect[ing] the natural environment and the people and wildlife that depend on it" (www.ejfoundation.org). In Scotland, meanwhile, the discourse focuses on "learning for sustainability", a concept linked to, but not entirely consistent with, environmental justice. Scotland hosts a "regional center of excellence" as part of a global network focusing on education for sustainable development, linked to UNESCO's international Sustainable Development Goals. Here, at the national center, learning for sustainability is described as "the umbrella term for sustainable development education, outdoor learning, global citizenship and social welfare" (<https://learningforsustainabilityscotland.org>). Sustainability also features as a key aspect of the professional standards, described as "understanding and valuing environment, culture and heritage, developing a sense of place and belonging to the local, national and global community. It also means having a deep connection to the natural world and understanding the significance of the choices we make—now and in the future" (GTCS, 2021, p. 3). This expectation in the professional standards sits alongside

“professional values” and “leadership” as aspects which permeate each of the standards comprising the career-long suite. So the emphasis on sustainability in Scotland appears perhaps more environmentally-focused than justice-focused in terms of the discourse, but the links between these two perspectives are clear, as explored below. More fundamentally, However, [Christie et al. \(2019\)](#) suggest that learning for sustainability as a concept, while entrenched in the policy discourse in Scotland, is not widely understood by teachers or teacher educators.

There is, it seems, a continuum of definitions that run from being mostly planet-focused on the one hand, to a mixture of planet and people-focused on the other. Regardless of the definition we adopt, there is clearly a link between social and environmental justice, something more explicitly addressed in the social work education literature ([Teixeira and Krings, 2015](#); [Beltrán et al., 2016](#); [Fogel et al., 2016](#); [Erikson, 2018](#)) than in the general literature on teacher education at present, perhaps due to the more targeted focus of social work provision, whereas teaching provision is universal. Here it is acknowledged explicitly that those most likely to be marginalized in society are also more likely to bear the brunt of environmental problems, and that part of the solution is to adopt a much more overt place-based approach, which “emphasizes ‘hands-on, real-world learning experiences’, increases students’ connections to their own communities, the natural world, and encourages commitment to local civic engagement” ([Beltrán et al., 2016](#), p. 498). This place-based approach engages students with real-world problems, but in so doing, challenges traditional disciplinary-based approaches to education ([Webber and Miller, 2016](#)). A commitment to environmental justice, just as with a commitment to social justice, forces us to understand and challenge forms of hegemonic and overt power which serve to disadvantage some and privilege others.

In summary, while acknowledging the challenges in defining social and environmental justice, and in incorporating these perspectives in teacher education programs, it is clearly possible to agree a common set of theoretical perspectives upon which to base program design, development and delivery. This is necessary, as [Goodwin and Darity \(2019\)](#) stress, in order to ensure that teacher educator knowledge is appropriate for the job of educating for social justice. This, in turn, links to the imperative of accessing and acting upon new knowledge and insight inherent in social progressivism.

Toward a working definition of socially progressive teacher education

This chapter argues that socially progressive teacher education can be unpacked and understood by drawing on three key ideas of social progressivism, pedagogical progressivism and social/environmental justice. The foregoing discussion discusses each of these in turn, drawing out their relevance for teacher education. While these discussions touch on the links between the three ideas, this section aims to consider in more depth how key principles in the three ideas might integrate to inform both understanding of, and practice in, socially progressive teacher education. [Table 1](#) below summarizes key principles underpinning each of the three ideas:

The above summary of underpinning principles highlights a number of key themes prominent in socially progressive teacher education, namely:

1. That knowledge is important;
2. That context matters, and place-based approaches to learning are an important consideration;
3. That both the individual and the collective must be attended to explicitly;
4. That a commitment to social and environmental justice must be conceptualized, understood and operationalized (rather than simply appearing in the discourse around a program).

The centrality of knowledge is explicit across each of these three key ideas. In political terms, social progressivism is founded on reform as a result of new knowledge/insights. This is fundamental to teacher education both in the design and delivery of programs,

Table 1 Key principles underpinning the three elements of socially progressive teacher education.

<i>Social progressivism as a political ideology</i>	<i>Pedagogical progressivism as an educational movement</i>	<i>Social and environmental justice as ethical imperatives</i>
Belief in reform as a means of pursuing social good.	Learner-centered approach, starting from what the learner already knows and has experienced.	Importance of conceptual understanding of social and environmental justice (on the part of both teacher educators and pre-service teachers).
Reform based on ever-evolving understanding of society as a result of new knowledge/emerging insights.	Learner-centered approach, but not individualistic.	Permeation rather than discrete specialist teaching.
Considering both local and global insights from new knowledge.	Emphasis on discovery and problem-based learning.	Importance of teacher educators’ social justice knowledge.
Being open to changing attitudes and practices in light of new knowledge.	Includes secure disciplinary knowledge which can then be drawn on in interdisciplinary ways.	Connection with learners’ contexts key, suggesting place-based learning approaches
Having the capacity to interpret and critique knowledge, leading to understanding of research which can inform future practice (reform).	Inculcates awareness and deeper understanding of one’s own thinking and learning: metacognition.	

and in the content of what is taught. Knowledge is not static, and therefore socially progressive teacher education must be based on the premise that one can never know everything one will even need to know, and that to engage with new research is an important aspect of a teachers' work. Research literacy, involving the capacity to consume research in a critical and context-appropriate way is therefore fundamental.

This links to the second key theme—that context matters. It is clear that socially progressive reform cannot happen in a vacuum, and that context therefore matters. However, attention to key principles underpinning pedagogical progressivism also serve to focus the gaze on issues of place. Place-based education, with its clear alignment to interdisciplinary approaches, context-based and experiential learning, can serve to make socially progressive reform more immediately relevant. For pre-service teachers, the idea of place-based education, rather than “placement learning” implies greater engagement with the communities in which pupils live and learn, thereby potentially requiring a re-conceptualization of the field-based element of teacher education programs. However, while Smith and Sobel's (2010) ground-breaking work on place-based education provides clear exemplification of how this approach might work in schools, translating it into teacher education is a little more challenging. In this respect, it is worth drawing on the growing body of work on community-based teacher education (Guillen and Zeichner, 2018; Yuan, 2018), which promotes pre-service student learning that engages them fully with the communities in which their pupils live and learn.

This inescapable attention to context inevitably places emphasis on working collaboratively for the collective good. However, when set against the learner-centered aspect of pedagogical progressivism, any enactment of social progressive teacher education will inevitably need to attend to a potential tension between the individual and the collective. In this regard, it is helpful to draw on learning from the literature on social justice teacher education, which emphasizes the importance of knowing oneself, and locating this knowledge in relation to others. In their own definition of social justice teaching, Aronson et al. (2020) state a commitment to promoting “social awareness and an ongoing process of critical consciousness toward self in relation to others” (p. 23). It is clearly possible to both learner-centered and collaborative, but this requires skilled negotiation and acute awareness, and arguably starts with teacher educators modeling this way of working themselves.

While social progressivism urges us to draw on knowledge and understanding in support of the common good, it is worth drawing on Biesta (2009, p. 35) warning that “while it is always advisable to use factual information when making decisions about what ought to be done, what ought to be done can never be logically *derived* from what is.” He goes on to assert that all judgments on education are to an extent value-based, made in relation to what is deemed (often implicitly) to be desirable. However, if we simply accept that any version of “good” is acceptable, then we run the risk of allowing social and environmental injustice to continue unchecked. Particularly in the context of education, it is important to be able to accept that somethings are innately not good, regardless of respect for other people's values and beliefs. This is where the concept of social justice, rather than the slightly more nebulous notion of social good is key. That is, the justice element implies something more tangible than simply “good” does. In socially progressive teacher education it is crucial to delve more deeply though, and to engage in active conceptualization of what social and environmental justice mean in the specific local, national and global context in question. The key message here is that from a socially progressive perspective, decisions about reform, even if based clearly on new knowledge, should not be made without reference to context.

The drawing together of themes from across these three key ideas that inform this conceptualization of socially progressive teacher education serve to highlight overlaps between the ideas, as well as attending more explicitly to the importance of context (in its widest sense, including historical, cultural, social, political and geographical elements). This allows a little more detail to be added to the figure presented earlier in the article, thereby explicating the concept of socially progressive teacher education in a little more detail, allowing inter-relationships between elements to be seen more clearly (Fig. 2):

In summary, socially progressive teacher education draws on political, pedagogical and ethical ideas which inform both its conceptualization and operationalization. It is underpinned by thinking on social progressivism as a political ideology, on pedagogical progressivism as an educational movement, and on social and environmental justice as ethical imperatives. This conceptualization is explicitly not neutral, rather it is driven by a desire for knowledge-informed reform which works for social good through participative and contextually-relevant approaches. Social good, from this perspective, adopts an explicit critical lens and works to identify and breakdown barriers to equity, fairness and progress.

In conclusion

Kohn (2008) says that “a school that is culturally progressive is not necessarily educationally progressive”, and presumably the same holds true for teacher education. That is, while the values and aspirations espoused might be socially progressive, this does not necessarily mean that the program will adopt a pedagogically progressive approach. The three prongs of the conceptualization put forward here are therefore co-dependent and all equally important. The socially progressive political ideology serves to make values explicit and to position reform in favor of social good as a key tenet. Pedagogical progressivism then serves as a blueprint for the design of the learning approaches in the teacher education program(s) prioritizing learner-centered approaches and collective, place-based problem-solving. Driving all of this is an explicit privileging of social and environmental justice serving as an ethical, conceptual and practical compass.

While all of this might makes sense conceptually, the real challenge is in enacting the principles herein. This is a job bigger than university-based teacher educators alone can do, rather it will involve a collaborative and activist orientation toward genuinely socially progressive teacher education at institutional, local and national levels. Such an endeavor will require bravery and

Fig. 2 Conceptualizing socially progressive teacher education and its inter-related elements.

a reconfiguring of control, but ultimately, to use socially progressive teacher education as a framing for this project seems not only to be defensible from a conceptual point of view, but also provides sufficient practical framing for program designers and leaders to make a genuinely socially progressive contribution to society.

We can readily observe inequity in our world. Racism, sexism, ableism, discrimination based on religion or sexuality, poverty, classism and colonization are examples of social forces that play out through our institutions and social lives, differentially impacting people and causing poorer outcomes for some members of society. Often these forces intersect, meaning people are multiply disadvantaged. For those who are not impacted, and enjoy positions of privilege, these forces can be invisible. Those who cannot see these forces in play run the risk of contributing to them and perpetuating harm to others.

Most 21st century societies have education systems. Depending on the history and current social context of a country, education might be available freely to all as a public good or reserved for just some people. In some places and times, education is regarded as a dangerous commodity, liable to liberate people's minds and hearts, while in others it is seen as a form of indoctrination and control. In fact, this distinction can occur within a place, where the same education system functions in different ways for different groups of participants. For some it might be an opportunity for personal growth and advancement. For others, in the same system, it might be an oppressive and dehumanizing force. Education is simultaneously a highly personal process of growth, with the potential for transformation, and a systemic process, whereby society offers young people a chance to learn valued knowledge, skills and attitudes. What is valued will differ by political, social, cultural, and historical context. These differences might be national, or they might be between states or provinces within a nation, or they might vary by tribal areas or religious groupings. Teaching, and teacher education, are political, both at the level of the personal power wielded by teachers and their choices and at the level of policy making (Cochran-Smith et al., 2008).

As well as being both personal and systemic, education is often positioned as both the illness and the cure. Education systems, commonly manifest as schooling, reproduce inequities and marginalize groups of learners through their intentions, content, and processes (OECD, 2018). At the same time, education is often positioned in policy and in international studies and comparisons, as the "way out" or the "way up" for underserved groups (OECD, 2018). Education systems are fundamentally intersected by the social forces that produce and reproduce inequity (Walby, 2007), but are tasked with making social change (in politically valued directions) (Pantic and Florian, 2015).

Initial teacher education and social justice

Initial teacher education (ITE) is an integral part of the education system and faces the same paradoxes: it is a process that individuals undertake as a personal journey, but it is simultaneously systemic: ITE is the provision of a "fit for purpose" workforce for schools. It is also the illness and the cure: if young people do not achieve the outcomes that are valued by the education system, teachers are inadequate, and if teachers are inadequate then their selection and preparation was inadequate. The way to fix this is to change, or more commonly reform, ITE and have "better" selection and "better" preparation in order to develop "better" teachers. What is "better" depends, in the same way as what is valued in schooling, on the political, social, cultural, and historical context in which the ITE takes place. As part of the education system, ITE is also intersected by the social forces that prevail through all institutions and social life. ITE does not sit outside the schooling system it serves, nor can it avoid the workings of racism, sexism, ableism, discrimination based on religion or sexuality, poverty, classism, and colonization that underpin the education system as a whole.

Thus, ITE is an integral part of education systems, fundamentally intersected by social forces that create and perpetuate inequities and shaped by national and international policy actions. In response to this positioning, some ITE thinkers, researchers and practitioners advocate “teacher education for social justice” (Cochran-Smith, 2004; Sleeter, 2008). Teacher education for social justice is an idea (Cochran-Smith, 2004) and a “slogan” (Zeichner, 2010) that arises from plural theoretical bases (Chubbuck and Zembylas, 2016) and may mean different things in different times and places because of different histories. Writers on teacher education for social justice particularly point to the rise and dominance of neo-liberal political and economic agendas as antithetical to promoting social justice through teacher education (for example: Bennett, 2021; Kaur, 2012; Sleeter, 2008). In some times and places ITE may be concerned with gender inequity, in other times and places with racism, and in other times and places with the impacts of social class, poverty or disability. Sources of inequity tend to overlap and intersect, meaning that often the intersectional impacts of social forces such as poverty, class, race and colonization are the focus of social justice initiatives. Sometimes these underlying forces are named and sometimes they are hidden within terms such as diversity or multiculturalism (Chubbuck and Zembylas, 2016).

“Teacher education for social justice” is therefore often used as an umbrella term for a range of ideas and commitments, for example culturally relevant/responsive pedagogy (Gay, 2000; Ladson-Billings, 1995; Villegas and Lucas, 2002), equity (Cochran-Smith et al., 2016; Nieto, 2000), and anti-racist education (Au, 2009; Kumashiro, 2000). For this reason, “teacher education for social justice” is something that many teacher education programs can include in their list of aims and aspirations, without necessarily troubling some of their processes or assumptions (McDonald and Zeichner, 2008). Many different teacher education program structures, arrangements, foci and experiences can be identified as serving social justice purposes (Cochran-Smith et al., 2008). For example, the idea of core practices (Ball and Forzani, 2009; Grossman et al., 2009) focused teacher education on key practices that research suggested led to more equitable outcomes. In response, Philip et al. (2019) explain that centering teacher education on core practices can push equity and justice to the periphery. Proponents of both points of view are trying to address inequity and social injustice, but they have different conceptualizations of what perpetuates inequity and injustice and therefore how they might be addressed in teacher education. Cochran-Smith et al. (2008) label this the “ambiguity critique” of teacher education for social justice, where the multiplicity of meanings and uses of the term “teacher education for social justice” render it impotent and hollow. This critique remains salient (Reagan and Hambacher, 2021). A key problem is that “teacher education for social justice” has been used as a disguise, in two ways: people use the term as a slogan, label or signal to others without doing anything meaningful about social justice in their teacher education programs (Zeichner, 2010), or people use it as a more palatable substitute term for activities that others might find threatening or offensive if they were properly named (for example, anti-racist education). This second use is shifting as public discourse shifts, with terms such as “race-visible teacher education” (Hambacher and Ginn, 2021) naming key concerns more precisely, however the term “teacher education for social justice” remains ambiguous. The slippery dual potential of being a smokescreen or a Trojan horse is problematic for promoting social justice through teacher education.

Defining teacher education for social justice

Theorists and researchers of teacher education for social justice have therefore sought to clarify the field through recourse to theories of justice from other fields (for example, Cochran-Smith et al., 2016; Chubbuck and Zembylas, 2016; North, 2006; Reagan and Hambacher, 2021); and reviews of empirical studies and frameworks of social justice in teacher education (for example, Reagan and Hambacher, 2021; Mills and Ballantyne, 2016; Kaur, 2012; Goodwin and Darity, 2019).

Trying to define teacher education for social justice using discourse from other disciplines or other areas of education research is an attempt to specify that social justice is not just about equality of resources or equality of opportunity (Chubbuck and Zembylas, 2016; Reagan and Hambacher, 2021). Offering everyone “the same” might seem “fair” or “equal,” but to tackle inequity in outcomes different groups of people will need different support and resources. Socially just distribution of opportunities and resources is not even, it gives more to those who experience greater disadvantage. For this reason it is about redistribution of social resources, not even-handed distribution of social resources. Social justice is not just about economic processes, however, it is also about recognition and representation (North, 2006). Recognizing and valuing the contributions of all groups is necessary for social justice, as is ensuring that all voices are heard in decision making processes. This three-part conceptualization of social justice, arising from the work of Fraser (Chubbuck and Zembylas, 2016), brings new discourses under the social justice umbrella. Social justice becomes not just about “who has what,” but also who is seen, heard and valued, and who is allowed to participate in decision making. These ideas are the basis for a structural understanding of how inequity is perpetuated. North (2006) notes that these ideas arise from, and are discussed in, largely US terms in her summaries of the field (North, 2006, 2008). Local histories of oppression and injustice are significant in determining what “teacher education for social justice” might mean when it is used in different places and times. However, in order to consider ITE’s contribution to social justice meaningfully, a definition of social justice is needed. Cognizant of the complexities summarized above, Mills and Ballantyne (2016)’s definition of social justice as encompassing “... a fair redistribution of resources and opportunities, recognition of differences, the representation of interests in decision making and development of capabilities to live fulfilling lives” (p. 263) can provide a useful way forward and is taken up here to underpin consideration of what teacher education can contribute to social justice.

As well as examining the theoretical origins of social justice in order to provide clarity about what teacher education for social justice might mean, scholars have synthesized empirical research and conceptual work within teacher education to try to find themes and commonalities that might describe the concept (for example: Reagan and Hambacher, 2021; Mills and Ballantyne, 2016; Kaur, 2012; Goodwin and Darity, 2019). Many authors develop frameworks to describe or explain teacher education for

social justice (for example: [Cochran-Smith, 2004](#); [McDonald, 2005](#); [Pantic and Florian, 2015](#); [Sleeter, 2008](#)). These syntheses and frameworks highlight components of teacher education for social justice (for example, courses, fieldwork, community placements, admission processes) and tensions in teacher education for social justice (for example, between individual agency and institutional processes).

Tension in teacher education for social justice

Underpinning any consideration of ITE's contribution to social justice is a central tension. Understanding this duality is important for understanding why the project of teacher education for social justice is difficult and contested. This central tension was introduced above: the tension between agency and structure, the personal and the political, the local sphere of influence and the broader system, the micro and the macro ([North, 2006](#)). Inequity is perpetuated by systems of power and privilege that work against redistribution, recognition and representation. These systems are peopled by individuals. One response to this is to say "if individual people change what they do, social justice will result." This response aligns with the work that says that teachers make a difference ([Hattie, 2009](#)). In this framework, while teacher differences do not account for all the variance in student outcomes, there is a sizable "chunk" of influence that they can exert as individual teachers, and concentrating their efforts on this space will lead to more equitable outcomes for learners ([Hattie, 2009](#)). Another response is to say "All the actions taken by teachers are shaped and constrained by systemic forces and it is these forces, played out through teachers' choices and actions that create inequity." In this framework, while teachers do have choices, these are fundamentally shaped by systemic practices and ideologies that constrain their agency to improve equity. At the two extremes we have teachers positioned as responsible for perpetuating inequity if their individual efforts are to no avail, or as abdicating responsibility to forces beyond their control and being satisfied with inequitable outcomes because they cannot make a difference. These extreme positions serve to make clear the agency/structure tension; in reality both how teachers perceive their roles, and how they play out, are somewhere on a continuum between these two positions, with context an important contributing factor. Preparing teachers to work within this tension is a fundamental concern of ITE ([Cochran-Smith et al., 2016](#)).

This tension plays out at all levels of the ITE system. [Fig. 1](#) below illustrates this by showing how, at three levels of the ITE system, both personal actions and systemic actions are called for by a commitment to teacher education for social justice. In this conceptualization, teacher education programs as entities can be seen as having some agency, or "personal" choice about what they deliver and how, while also being shaped by the systems of which they are a part. In all the layers, while a useful distinction can be made between acting personally or acting systemically, action in these two spaces is related. Coming to understand one's cultural positioning, a highly personal task, can fuel action at the system level. Activism at the system level can cause re-examination of personal practices. The difficult part is that the knowledge and skills required to undertake the personal actions are different from the knowledge and skills required to undertake systemic actions ([North, 2006](#)). For example, knowing what inclusive pedagogies are and how to enact them with young learners is a different knowledge and skill set to knowing how to work with parents and community groups to advocate for changes to curriculum or policies. This poses a dilemma for ITE: should ITE prepare teachers to have the knowledge, skills and attitudes to work for social justice in both their personal sphere and at a systemic level? How do PSTs, teacher educators and teacher education programs navigate the tension between knowing that as a teacher you can do some things, but your work is shaped by broader social forces too ([Cochran-Smith et al., 2016](#))?

[Fig. 1](#) is an illustration of how the individual/systemic tension is present in multiple layers of teacher education for social justice. There are other layers, and other places, in which this tension plays out, but [Fig. 1](#) serves to show that a commitment to teacher education for social justice implicates both individual and systemic actions by more people and organizations than just individual

	Personal	Systemic
PSTs	Enacting culturally responsive pedagogies in classrooms Understanding their cultural positioning	Advocating against streaming or grouping by achievement level
Teacher educators	Using inclusive practices with PSTs Understanding their cultural positioning	Participate in designing admission processes that are equitable
Teacher education programs	Design programs with learning experiences that are known to enhance social justice commitments and competencies in PSTs.	Advocate with regulatory and approval bodies for socially just processes

Fig. 1 Examples of individual and systemic activities in teacher education for social justice.

PSTs. This suggests that ITE's contribution to social justice has to consist of more than just the provision of "socially-just teachers" for the education system.

ITE's contribution to social justice

ITE's contribution to social justice can be framed in two ways. These framings are simplifications, but they expand the tension described in the previous section, and broadly represent the arguments that are used to promote the idea that social justice has a place in teacher education. The first framing centers on the personal aspect of teaching for social justice: student outcomes from schooling are unjust, teachers have a significant influence on student outcomes (Hattie, 2009), teachers should teach in ways that promote social justice to produce more just outcomes, therefore teachers need ITE that prepares them with the knowledge, skills and attitudes to teach in ways that promote social justice. The second framing focuses on the systemic aspect of teaching for social justice: schooling is systemically disadvantaging groups of students, teachers are working within structures that shape and constrain their actions and individual efforts will not overcome these structures (and the structures are often invisible and unwittingly perpetuated by teachers), teachers should therefore be advocates for change to systemic inequities and processes that lead to unjust outcomes, therefore teachers need ITE that prepares them to be advocates and activists. These two framings are not necessarily incompatible, but they allow a wide scope for teacher education programs to claim they are providing teacher education for social justice (McDonald and Zeichner, 2008) and a program that attempts to do both has a very big agenda. For example, Sleeter (2008) conceptualizes social justice in teacher education using three strands: "supporting access for all students to high-quality, intellectually rich teaching that builds on their cultural and linguistic backgrounds, preparing teachers to foster democratic engagement among young people and preparing teachers to advocate for children and youth by situating inequities within a systemic sociopolitical analysis" (p. 611). The first of these strands covers the personal aspect described above, and the third strand is part of the systemic aspect described above, with the second strand combining the two: PSTs should be able to encourage engagement with social justice ideas among their students. This strand involves both knowing what and how to teach and being able to provide a systemic critique.

The following sections consider the contribution of ITE to social justice by taking the three levels in Fig. 1 and thinking about the contributions ITE can make to social justice at each of these levels. A three-level framework is used for this explanation in order to make it clear that there are more ways that ITE can contribute to social justice than through the PSTs it graduates. In a similar way to the key tension outlined above, seeing ITE's contribution to social justice as only in PSTs' teaching is ignoring the role ITE can play at a systems level. In practice, the three levels are interdependent with respect to promoting social justice. There is a point at which understanding the relationships among the levels becomes more explanatory than making a distinction between them. A final section considers these relationships and the ways in which ITE could make a greater contribution to social justice than it does at the moment.

Contributions through preservice teachers

One way in which ITE can contribute to social justice is through the PSTs that it works with. Most empirical work on teacher education for social justice centers on PSTs: their beliefs, attitudes, competencies and experiences (Mills and Ballantyne, 2016). In the US, and other colonial jurisdictions in particular, a key driver for social justice in teacher education is the "demographic imperative" (Cochran-Smith, 2004). The demographic imperative arises when the teaching workforce does not "match" the students they teach in terms of race, language and social class. There are two responses to this: recruit and admit PSTs who are more representative of the student population, or try to make the "mismatched" PSTs recognize their positioning and its implications for their students. Both of these approaches lead to difficulties for PSTs from non-dominant groups.

In actively recruiting more diverse students we may be using the logic "adding more teachers of Color in schools with majority students of Color from high poverty communities will change the schools, transform the educational experiences for the students and close the achievement gap" (Haddix, 2017). Inevitably, when this does not work because of systemic racism, the teachers of color will be blamed (Haddix, 2017). While diversifying the teaching workforce is a way to have new voices heard and knowledges shared, expecting people from oppressed groups to solve the problems created by the dominant system is unreasonable and unlikely to succeed.

Jackson et al. (2017) present an interesting perspective on the second approach—helping PSTs to recognize their positioning. PSTs of Color are the co-authors of this piece, which explores the experience of learning about teaching for social justice from a professor of Color in a predominantly white institution and teacher education program. Jackson et al. (2017) point out the ways that race intersects this experience: the professor of Color teaches the social justice course which creates a racialized dynamic with the white students that is further complicated for the PSTs of color who are positioned differently in relation to the material. Three assumptions are critiqued in this work: first, that PSTs of Color will automatically know how to teach for social justice, second that, being of Color or a member of a marginalized group in education automatically means that you know and understand about all marginalized groups and have no misconceptions, and third that the learning experiences in the course are shifting the positions of the white students (Jackson et al., 2017).

Studies of PSTs and teaching for social justice are often small, focused on one course or program and rely on one source of data, most commonly interviews (Mills and Ballantyne, 2016). This makes it difficult to know whether teacher education for social justice

is making a contribution to social justice in schooling through the knowledge, skills and attitudes of the PSTs it graduates. [Cochran-Smith et al. \(2009\)](#) describe the outcomes of a social-justice oriented teacher education program, emphasizing that the PSTs had not abandoned a focus on learning in order to teach in “good and just” ways. The PSTs in this study emphasized relationships, focused on learning for every student and took a critical stance toward their work. There was little evidence of them taking up the advocacy or activist elements of social justice. This study has a longer timeframe than many ([Mills and Ballantyne, 2016](#)), and tries to specify what social justice teaching might look like in PST practice. In doing so it suggests that it is possible for teacher education to shape PSTs to take up social justice commitments in their teaching and marry these with some practices that support their goals.

Contributions through teacher educators

One resource that teacher education has, which is often overlooked in the discussion of teacher education for social justice, is teacher educators. Studies often consider the impacts of program structures or practicum arrangements without acknowledging that it is educators who make these things happen, and that their attitudes, knowledge and skills impact teacher education for social justice. “Who teaches material relating to social justice?” is a key first question. Whose voices are heard in the teacher education space? What help and support are teacher educators offered to teach for social justice themselves? Do the teacher educators teach in ways that promote social justice in their own classes? Are the teacher educators critical and activist in their stance toward their work? Teacher educators in university settings could be advocates and models for teaching for social justice across disciplines as well as teaching PSTs in inclusive ways and helping to dismantle structures that perpetuate inequity in their institutions. Recent research work on teacher educators suggests that reaching that point will be a difficult and complex journey. Some of this work is described below to highlight how the key tension between the personal and the systemic elements of teacher education for social justice play out in the teacher educator space as well as with PSTs.

[Goodwin and Darity \(2019\)](#) reviewed literature from three jurisdictions that centered on teacher educators’ knowledge for teaching social justice in teacher education. Their findings echo the fundamental tension outlined above: teacher educators highlighted personal and contextual knowledge in teaching for social justice, and pedagogical, sociological and social knowledges were largely absent from the studies and from the discussion. This suggests that teaching for social justice is generally being taught by teacher educators as a personal and local task (which it is, in part), with the larger structural elements and critiques being absent. [Goodwin and Darity \(2019\)](#) call for formal preparation for teacher educators. Formal preparation would give space for prospective teacher educators to build their knowledge and understanding of teaching for social justice and to work out what it means for their own practice.

[Souto-Manning and Winn \(2019\)](#) list commitments that teacher educators need to take up in order to provide socially-just teacher education. Their first suggestion is “suspend harm as an ethical imperative,” pointing out the harm that teacher educators currently cause through the frames they communicate about students and schooling. [Jackson et al. \(2017\)](#) provide a valuable perspective on this when they report experiencing teacher educators as framing issues of race and equity around “... the failure of students of Color (Black students in particular) rather than the failure of the education system” (p. 104). Again, this links to the central tension above—locating social justice issues in personal rather than systemic spaces.

[Gorski and Parekh \(2020\)](#) provide data on institutional structures that may serve to maintain the status quo in teacher education for social justice. Noting that most North American teacher education programs put “equity-related skills” into one course, and that these courses vary from appreciating diversity and cultural competence to having a critical orientation and an activist stance (p. 265), [Gorski and Parekh \(2020\)](#) asked teacher educators for their perceptions of the criticality of their course and the support of their institution for the values they teach. They found a negative relationship between the two factors—teacher educators who took more critical approaches perceived that there was less institutional support for their work. Teacher educators, especially in universities, are often working in spaces that act as engines of privilege. This poses a challenge to teacher education for social justice, especially if teacher educators themselves do not recognize what is happening.

[Dover et al. \(2020\)](#) report on a promising practice for developing teacher educators’ social justice teaching. They formed a “faculty learning community” that created a space for teacher educators to critically evaluate their teaching for social justice, to understand the impacts of their practice and to consider how it was shaped by institutional and social forces. Like [Souto-Manning and Winn \(2019\)](#), [Dover et al. \(2020\)](#) point out that when teacher educators continue to do what they do they “either reinforce or actively perpetuate unjust, racist and unequal practices” (p. 62). Interrupting this, with collegial support, is necessary for teacher education for social justice to take place.

Teacher educators in many jurisdictions do not “match” diverse school populations, nor do they “match” the increasing diversity of PSTs. In Western colonies in particular, whiteness pervades teacher education ([Bennett, 2021](#); [Deckman and Ohito, 2019](#); [Souto-Manning and Winn, 2019](#)). However, as with the PSTs discussed above, teacher educators are not a homogeneous group. A response to social justice imperatives is to hire more diverse faculty members, but in the same way as recruiting more diverse PSTs, this is not a solution. [Deckman and Ohito \(2019\)](#) reflect on their experiences as Black women teacher educators in White teacher education spaces, revealing the multiple complexities of their positioning and their work. In particular they point out that while social justice as a term has connotations of healing and reconciliation, it is important to consider who benefits from teacher education for social justice and who might be harmed by it. For example, if we know that discussing issues of race is difficult work and that PSTs can be angry and anxious about it ([Jackson et al., 2017](#)), who are we asking to do that work? Is it people who have already been harmed by the racism they are being asked to work with explicitly?

The contribution of teacher educators to teacher education for social justice needs deeper consideration by researchers and practitioners. There are personal considerations: what do teacher educators do when they teach social justice? What are the experiences of teacher educators teaching for social justice? However, the greater considerations are systemic: who does the work of teacher education for social justice, and why? Why are some groups of people missing from teacher education? What institutional structures hold harmful practices in place? What supports are there for teacher educators to change their practice? Who does teacher education for social justice really serve?

Contributions through program structures, content and design

Discussion of teacher education for social justice often takes place at the program level. Programs of teacher education claim to be social justice oriented, or to promote social justice (McDonald and Zeichner, 2008). Discussions at the program level tend to center on the arrangements and activities in a program: courses, assignments, fieldwork/practicum and community or service learning, for example (Sleeter, 2008). Gorski and Parekh (2020) claim that in most North American programs, social justice content is confined to one or two courses on “multiculturalism” or “diversity,” rather than being taken up across courses in a program. Jackson et al. (2017) highlight a lack of coordination across programs, with students reporting that “everyone gives the same Ladson-Billings article but no one unpacks it” (p. 106). Chubbuck and Zembylas (2016) explain the need for holistic teacher education programs with a coherent and integrated focus on social justice if teacher education for social justice is going to be effective. Program-level structures need to be aligned with, and express, social justice aims, not just single courses or teacher educators (Cochran-Smith et al., 2016).

McDonald (2005) provides a case study of two teacher education programs with explicit commitments to social justice, and examines the nature of student teachers’ opportunities to learn about social justice in these programs. She offers a framework for thinking about programs on two dimensions: the elements of social justice that PSTs get the opportunity to learn about (from individual through to institutional) and whether these opportunities are conceptual or practical. Her analysis suggests that PSTs get more opportunities to learn about individual students and their needs than groups of students and recognition of oppression and its institutional causes. In addition, they get more opportunities to engage with conceptual tools than practical tools for teaching for social justice. This is echoed in Jackson et al. (2017) who report being given theoretical or conceptual work and being asked to work out for themselves what it might mean in practice.

All of the programs discussed above can be critiqued as centering Whiteness and European concerns (Bennett, 2021; Souto-Manning and Winn, 2019). Whitinui et al. (2018) present a range of promising practices in teacher education that are built on indigenous frameworks and concerns. Programs that are centered on indigenous world views present different opportunities, and meanings, for teacher education for social justice. Clarke et al. (2018) describe how a teacher education program was devised as a collaboration between Māori (the indigenous people of Aotearoa New Zealand) and a teacher education provider. This collaboration led to a program that was centered in Māori worldviews and approaches, with the metaphor of a braided river bringing together streams of knowledge at the heart of the program. Social justice in a program oriented in this way does not reinforce a deficit narrative about indigenous learners, nor is it approached from a Western point of view. Programs of this type suggest a way forward for teacher education to make a greater contribution to social justice.

Making a greater contribution

How, then, could ITE make a greater contribution to teacher education for social justice? Four ways forward can be seen from looking across the literature about frameworks and practice in social justice teacher education. Each of these four directions is considered briefly below.

Centering new voices, frameworks and knowledge

It is difficult for teacher education to contribute to social justice when it begins from unquestioned, dominant frameworks and practices. A greater contribution could be made if different voices and knowledges were centered in teacher education programs. Community involvement in designing teacher education (McDonald and Zeichner, 2008), beginning with indigenous frameworks (Clarke et al., 2018) or centering justice (Philip et al., 2019) are starting points for building social justice into the structure of teacher education, rather than making it a goal or outcome. Teacher education that is designed through a socially-just, power-sharing process is more likely to have arrangements, content and graduates that reduce inequity.

Criticality and inquiry

Two approaches to teaching and learning, and teacher education, that are associated with social justice practice are criticality and inquiry (Bennett, 2021; Cochran-Smith et al., 2016). Neither of these is a guarantee of deep learning about social justice as they can be undertaken superficially or without understanding (Kaur, 2012) but, when taught and used sincerely, criticality and inquiry are ways of thinking and approaching teaching that can promote social justice. Sustained use of criticality and inquiry throughout

a teacher education program, and by the teacher educators within a program supports PSTs to adopt these mindsets as habits, and apply them to their own practice.

Place based, embodied, experiential connected teaching and learning

Teacher education takes place in a context, and while there are international commonalities, responding to local conditions and histories is a way to contribute more to teacher education for social justice. Indigenous pedagogies or those from other community groups can make a significant contribution to how PSTs engage with social justice ideas and practices (Clarke et al., 2018; McDonald and Zeichner, 2008; Deckman and Ohito, 2019). Learning from these pedagogies and learning how to enact these pedagogies are both ways to increase teacher education's contribution to social justice. Embodied and experiential learning are useful approaches because they acknowledge the emotional and embodied nature of the learning that takes place when PSTs (and teacher educators) engage with social justice ideas and practices (Reagan and Hambacher, 2021).

Be practical, not just conceptual

Although a criticism of ITE at present could be that there is not enough consideration given to larger ideas about structural inequity and too much emphasis is placed on learning about catering to individual difference (Philip et al., 2019; Sleeter, 2008), a counter-intuitive problem also emerges from the literature: teaching about social justice is conceptual where it needs to also be practical (Goodwin and Darity, 2019; Jackson et al., 2017; McDonald, 2005). PSTs report being given assignments where they read about social justice and then are asked to create lesson plans that reflect what they have read. Goodwin and Darity (2019) note that there is rhetoric of social justice in the work they reviewed, but not necessarily practice. Being clear about how social justice ideas and commitments play out in schools and in teacher education spaces would contribute to teacher education for social justice. Practical examples from a range of settings, illustrating key principles and sparking focused discussion and reflection would help PSTs and teacher educators fully understand what teacher education for social justice means and what it can do.

Conclusion

Teacher education is part of education systems that reproduce inequities. For this reason teacher education needs to contribute to social justice. This effort is complicated by a lack of clarity about what social justice might mean and how teacher education might help. Social justice in schooling involves both individual actions that are just and systems that are just. ITE needs to prepare PSTs who can teach in ways that are socially just and contribute to reforming systems that perpetuate inequities. This can be hard to do when many teacher educators and PSTs are racially, socially and culturally "insiders" to the education system, where many of those they are working with have been positioned as "outsiders" to the education system. Institutional and broader social systems also hold processes and structures in place that reproduce inequity.

The contribution that ITE makes to social justice is limited by its position in the education system and its institutional nature. It is also limited by the attitudes, knowledge and skills of those involved in teacher education. These two limits reflect the core tension of teacher education for social justice: that it is about systemic influences and personal influences. Across both of these sets of influences, learning to teach for social justice involves dealing with difficult things. It is not a neutral activity. There is hard personal work to be done by many PSTs and teacher educators. Teaching for social justice makes demands of people that they may find hard to fulfill.

Introduction

Although online teaching and learning are not new, the outbreak of the COVID-19 pandemic in 2020 has indelibly marked teacher education practices due to the forced and global transition to online environments as a result of the closure of teacher education institutions and schools worldwide.

An “online emergency remote teaching” (Bozkurt and Sharma, 2020, p. ii) became a reality in many parts of the world in order to meet the challenges arising from the closure of the institutions. What became immediately evident was the digital gap visible in the inequalities in terms of access to adequate equipment, resources and interactivity for online teaching and learning but also in terms of digital literacy from the part of various stakeholders (Flores et al., 2021b). Moving from face-to-face to the online format has been seen by the more enthusiasts as a revolution in education while others are more cautious and alert to the exacerbation of inequalities and exclusion (Flores and Gago, 2020). Institutions around the world developed new strategies and scenarios for online teaching and learning and research has shown that a more positive adaptation has been associated with personal (e.g. self-regulatory and socio-emotional competences) and contextual factors (e.g. support, feedback) (Flores et al., 2021a).

Despite the variety of responses, online teaching and learning practices became not only necessary but also entailed a global response to a situation of crisis that was new and unexpected and that, at least, challenged existing practices. It is, therefore, possible to identify a before and after the COVID-19 pandemic for online teacher education that needs to be examined in all its dimensions. As Darling-Hammond and Hyler (2020) assert, there is a need to pay attention to teaching and teacher education during the pandemic and beyond and to invest in strategies aimed to support the social, emotional and academic needs of students through high-quality educator preparation, opportunities for professional development, mentoring, and the creation of the conditions for educators to collaborate. These issues raise a number of questions that need to be addressed, namely: To what extent have online teaching and learning practices in teacher education been changed (or at least challenged) during and in the post-covid time? What are their effects on the process of learning to teach? How has teacher educators and student teachers’ work been affected during the pandemic? What are the implications for the future of teacher education?

Situating COVID-19 as a turning point in online teacher education, this article aims to analyze online teaching and learning practices before and after the irruption of the pandemic to understand the nature and the kinds of practices and factors affecting impact in the online environment. As such, this article is organized around three parts. First, we look at the pre-covid time—the past—by summarizing what is known in the field. This section draws on previous work (Carrillo and Flores, 2020) and aims to provide an overview of what has been done in the pre-covid era in terms of online teaching and learning practices. Our first review included papers published between January 2000 and April 2020, leaving outside the more recent studies that examine issues on online teaching and learning in the exceptional circumstances of the COVID-19 pandemic. In such unexpected scenario, higher education institutions had to rapidly adapt to remote teaching in order to meet the requirements of the programs and to provide students with opportunities to learn and to meet the course goals. However, it is important to move beyond an emergency online

teaching and learning response and look at evidence-based practices driving impact. Thus, the second section is devoted to the COVID-19 time—the present—and, drawing also on previous work (Carrillo and Flores, *in review*), it explores the context and circumstances in which higher education institutions have had to develop online practices. Such a goal is important to understand the particularities of the moment and the decisions made in the transition from the face-to-face to the online format. It is, therefore, essential to examine how educators have adapted to remote teaching after the irruption of the pandemic, the conditions for operating teaching and learning and the strategies used in such challenging circumstances.

Finally, in the last section of this article, we examine the implications of the findings for online teaching and learning practices in teacher education—the future—and we discuss future trends and avenues for further research.

The three sections will be guided by the following research questions:

- What online practices have been demonstrated to drive impact on the teaching and learning process in the context of teacher education before the irruption of the COVID-19?
- What online practices and factors have been demonstrated to influence impact on the teaching and learning process in the context of teacher education after the outbreak of the virus?
- What are the implications of the findings derived from the two previous research questions for online teaching and learning practices in the post-pandemic time?

Methods

This article reports on data gathered from two searches of the literature on online teaching and learning practices in the context of teacher education. The first one includes publications between January 2000 and April 2020 and the second one focused on the period April 2020–April 2021. The selection process started with a search in the databases Web of Science (main collection) and Education Resources Information Center (ERIC).

Publications whose descriptors included the terms “online learning” (or “digital learning” or “e-learning” or “web-based learning” or “remote learning” or “distance learning” or “virtual learning”) and “teacher education” or “teacher training” or “teacher preparation” were sought. Albeit such terms and expressions entail different meanings and understandings, all of them were considered for the purpose of the study of teaching and learning practices in teacher education mediated by the use of technology in a remote scenario.

First study

In total, the search focusing on publications between January 2000 and April 2020 led to the identification of 134 papers which fulfilled the inclusion criteria established for this research in terms of the publication source (academic journals), the nature of the studies (empirical), and the relevance of the topic (main focus on online teaching and learning practices in the context of teacher education).

The 134 papers were subject to two types of analysis. First, a descriptive analysis was conducted. It implied the elaboration of a summary table for each of the papers specifying the focus of the study, characteristics of the sample, the methods and the main findings (due to the word limit, this table is not included in this article). Second, a content analysis (Ryan and Bernard, 2000) was undertaken following the Community of Inquiry Framework (CoI) (Garrison et al., 2000) to identify the categories. This framework is based on the idea that learning is the result of the interaction of three presences: (a) social presence, associated with the ability of participants to engage affectively with a community, communicate purposefully in a collaborative environment, and develop interpersonal relationships by projecting themselves as the people they are (Garrison et al., 2000); (b) cognitive presence, or the extent to which the participants are able to construct meaning through sustained reflection and communication in a community of inquiry (Garrison et al., 2000); and (c) teaching presence, related to the design, facilitation and direction of social and cognitive processes with the aim of achieving meaningful learning outcomes (Anderson et al., 2001). A cross-analysis of the data as related to each category (social, cognitive and teaching presence) was carried out in order to identify patterns that make sense beyond each specific case (Huberman and Miles, 1994) but also taking into consideration the peculiar features of each paper.

Peer reviews conducted through regular exchanges between the two researchers and co-authors, the second not directly involved in the data collection and analysis, provided an external check of the research process (Lincoln and Guba, 1985). This researcher (second author) regularly reviewed the material generated and contributed with comments on both the methodological process and the product. The insights provided by this researcher on the selection of the databases, the criteria established for the search, the types of analysis conducted and the accuracy of the analysis (process) as well as on the assessment of how the findings, interpretations and conclusions of this study are supported by the data (product) allowed to refine the research process.

Second study

As for the publications between April 2020 and April 2021 a total of 20 papers were considered taking into account the same above inclusion criteria. In addition, a manual search through the bibliography of some key papers (Bryman, 2012) was carried out in a second phase. This process was guided by the same inclusion criteria (see above) and generated eight additional papers.

Similar to the first study, a descriptive analysis was conducted which included the elaboration of a summary table for each of the papers specifying the focus of the study, characteristics of the sample, the methods and the main findings (due to the word limit, this table is not included in this article). Then, a systematic inductive analysis (Hatch, 2002) was carried out that took the researchers to independently read and identify salient domain connected with the second research question (practices and factors influencing impact in online teacher education); to reread the data to refine salient domains and confirm if these are supported by the data; to search for themes across domains, and; to discuss and agree on the final themes of analysis. These were established as follows: in relation to practices influencing impact, the characteristics of online teaching and learning practices and the reflexive element of the practicum; in relation to factors, the personal and contextual elements, the “caring” component and the challenges encountered in the transition to online education.

To warrant accuracy of the research process, two “verification” strategies (Creswell, 1998) were used. Member checking (Doyle, 2007) by the two researchers and co-authors was performed in order to verify the interpretation of the data. Also, detailed descriptions of the results are provided to allow readers to make decisions regarding transferability of the findings (Erlandson et al., 1993).

The main findings of the second study and a summary of the first study will be presented in the next two sections. Also, in light of the three main research questions identified in the introduction, a final section focusing on the implications for teacher education in the future will be included.

Online teaching and learning practices driving impact in teacher education in the era pre-covid

Out of the papers examined in the first study, only a few focused primarily on the *social presence* (e.g. Hramiak, 2010; Komninou, 2017; Li, 2011; Satar and Akcan, 2018; Yeh, 2010) although the vast majority included issues related to this presence and highlighted its centrality in terms of teaching and learning effectiveness. The ability of teachers and learners to engage affectively in relationships emerged as a key element in meaningful educational experiences. According to the papers reviewed, the factors influencing the establishment of a social presence included:

- Belongingness: shared values and interests; trusting human relationships.
- Cohesiveness: collaboration in small groups; high levels of support; affective responses.
- Optimal level of social presence:
 - By instructors: balance between providing support and leaving room for student participation.
 - By learners: developing an active and inclusive attitude.
- Interactivity: regular discussions; prompt communication; timely contributions; interpersonal interactions.
- Participation: authentic and practical activities; relevant commenting; prioritization of social interaction over the completion of the task.

The papers reviewed also suggest that the interplay of the social presence with cognitive and teaching components was key to ensure teaching and learning impact. The interactions that supported social presence were multiple, iterative and reciprocal (Hou, 2015) and they were fundamentally based on mutual respect, interdependence and trust to focus on the interpersonal connection between the members involved (Ham and Davey, 2005).

The *cognitive presence* was subject to actions of a social and pedagogical nature, although limited attention to the specific features supporting its development was sometimes detected. This may be explained by the difficulty to distinguish the elements of the learning environments that influenced knowledge development (Evens et al., 2017) or by the lack of a sound pedagogy of online education (Ham and Davey, 2005). Overall, the factors influencing the establishment of a cognitive presence according to the papers reviewed are related to:

- Concrete experience: sharing teaching experiences; observing the most practical videos within authentic classrooms situations.
- Contextualization and conceptualization: facilitating the active intervention of both instructors and learners in the process of constructing meaning; promoting interactions that go beyond mere description of field experiences; reflecting on each other's ideas; integrating different perspectives.
- Action development: developing critical personal teaching practices; addressing pedagogical challenges.

From the papers revised it was evident that the development of high-order cognitive skills required not only strong social presence, but also the ability of the teacher to guide students' collaborative efforts in the transition from content reflection to critical reflection (Kreber and Cranton, 2000). This occurred as a response to a triggering event (concrete experience), which was followed by a collective process that entailed making sense of this event (exploration), integrating different ideas into a more coherent framework (integration), and developing personal teaching practices (resolution) (Garrison et al., 2000).

In turn, the *teaching presence* was connected with the social and cognitive components in online teaching and learning practices. Examples of such presence were associated with the design and facilitation of online teaching and learning as well as to broader issues related to the pedagogical approach. The factors influencing the establishment of a teaching presence according to the papers reviewed include:

- Pedagogical approach: learner at the center; teacher as a facilitator; knowledge integration.
- Learning design: flexible; personalized; contextualized; social; formative; use of appropriate tools and technology.

Table 1 Issues leading to impact related to the social, cognitive and teaching presence (according to the papers reviewed).

<i>Presence</i>	<i>Key issues</i>
Social presence	• Belongingness • Cohesiveness • Optimal level of presence by instructors and learners • Interactivity
Cognitive presence	• Participation • Concrete experience • Contextualization • Conceptualization
Teaching presence	• Action development • Pedagogical approach • Learning design • Facilitation

Adapted from Carrillo and Flores (2020).

- Facilitation: clear expectations; appropriate questions; acknowledgment of cultural issues; timely, constructive, specific and detailed feedback; students' attitude and commitment.

Contextualized (e.g. based on everyday teaching situations), personalized (e.g. targeting individual differences), social (e.g. resulting from the interaction with others), formative (e.g. focusing on the process), and integrated (e.g. considering both formal and informal ways of learning) practices were influential to the effectiveness of the online teaching and learning process. Added to this was an active and thoughtful participation of all the members involved in the online learning environment in the achievement of effective practices. As such the need for a comprehensive and solid view of online pedagogy in the context of teacher education is advocated by acknowledging the complex interactions between the components involved in the online teaching and learning process (e.g. instructors, students, task and technology factors) (Borba et al., 2018; Mumford and Dikilitaş, 2020), including instructors' and students' previous experiences and dispositions toward online teaching and learning tools, to develop effective educational experiences that address their different (and changing) roles and evolving identities.

Table 1 synthesizes the main issues leading to impact connected with the three presences before the outbreak of the pandemic.

Online teaching and learning practices and factors influencing impact in teacher education in the era post-covid

Practices influencing impact in online teacher education

Characteristics of teaching and learning practices

The literature analyzed shows that online teaching and learning practices that used appropriate digital tools and were accessible, authentic, collaborative, democratic and personalized supported impact in online teacher education environments.

Use of appropriate digital tools

When remote teaching became the forced normal, technology tools allowed teachers and learners to continue their education. The literature analyzed provides examples of how digital resources impacted learning through both synchronous and asynchronous formats and with different purposes. Video conferencing was often undertaken using Zoom (Ghazi-Saidi et al., 2020; Kalloo et al., 2020; Quezada et al., 2020; Weaver et al., 2021), BlackBoard Collaborate (la Velle et al., 2020; Quezada et al., 2020), Microsoft Teams (la Velle et al., 2020) and Google Meets (la Velle et al., 2020; Sutiah et al., 2020), either through synchronous (live) or asynchronous (recorded) sessions. Additional digital resources used by the educators in the studies examined were mainly asynchronous in nature and provided opportunities for collaborative learning (e.g. Flipgrid for stimulating discussion around a given topic; Google Docs, Canvas or Padlet for working collaboratively and sharing documents) as well as for communication (e.g. Email and WhatsApp for communicating with trainee teachers) and self-directed development issues (e.g. mini-MOOC for developing specific skills; Google Classroom for sharing additional learning resources for the students) (Başal and Eryilmaz, 2021; Boltz et al., 2021; la Velle et al., 2020; Sutiah et al., 2020; Weaver et al., 2021).

Accessibility

In terms of characteristics of online teaching and learning practices influencing impact, accessibility showed to be an important prerequisite which encompassed both the design and delivery of the teaching materials and a flexible approach to the teaching and learning process (Scully et al., 2020). In regards to the former, Turchi et al. (2020) found that making sure that digital resources were accessible through institutional systems of the local public libraries in both university and school settings was important to achieve impact. This was also evident in Scully et al. (2020), who in addition highlighted that a flexible perspective that included team teaching, supported students' interaction and allowed teachers to respond to students' questions in real time in synchronous

activities. Within this second perspective, Coolican et al. (2020) also demonstrated how flexibility in terms of approaches to teaching and learning (e.g. teaching practices, theories underlying teachers' work) was relevant to effectively manage the virtual environment.

Authentic learning

When it comes to authentic learning, the literature examined showed how specific teaching dynamics and activities contributed to student teachers' engagement and meaningful learning. O'Brien et al. (2020) revealed how small group discussion in breakout rooms delivered meaningful episodes of experiential student learning and resulted in increased efficiency and engagement. Breakout rooms driving impact included clear expectations for timed student interactions and assignation of appropriate collaborative tasks (Kidd and Murray, 2020; Metscher et al., 2021). Quezada et al. (2020), Turchi et al. (2020), Weaver et al. (2021) also used small-scale discussion boards and digital tools to share ideas and build opportunities for sense making, which provided students with the opportunity to interact and engage with course content. This was often preceded by a triggered event such as the observation of videos (Ellis et al., 2020; Kidd and Murray, 2020; la Velle et al., 2020; Metscher et al., 2021), the engagement with readings about teaching (Metscher et al., 2021) or the use of authentic cases in online educational settings (Willems et al., 2021), which provided students with realistic opportunities and challenges to understand course content, support self-regulatory practices and enhance motivation.

Collaboration and collaborative learning

Small group discussion allowed student teachers to build learning in collaboration with the others (O'Brien et al., 2020; Turchi et al., 2020). Through breakout rooms and other collaborative digital tools (e.g. chat room features, Google docs), participants were able to share ideas, build on one another's responses and learn from each other (Başal and Eryilmaz, 2021; Turchi et al., 2020; Weaver et al., 2021). Collaboration in times of COVID-19 pandemic, however, was present across different educational stakeholders, beyond the boundaries of the classroom and with other purposes besides learning. In a college setting, collaboration increased opportunities to work and communicate within different departments (e.g. school management, administration and teachers) to address the challenges of the virtual environment (Coolican et al., 2020). In the context of teacher education programs, collaboration was also established through community-building activities aimed to promote a sense of belonging among students to deal with issues such as anxiety or loneliness (Metscher et al., 2021).

Democratic approach to teaching and learning

Online teaching and learning practices after the irruption of the pandemic derived toward a more democratic approach in which the dynamics of power between teacher and student blurred and more explicitly acknowledged the figure of the student as a key component for teachers' development and teaching and learning impact. Turchi et al. (2020), Quezada et al. (2020), for example, highlighted how teachers regularly asked their students for feedback after their lessons as an opportunity to voice their opinions and learn more to improve their practices. Cutri et al. (2020) also described classroom situations in which students' technological expertise surpassed educators', thereby contributing to revert traditionally assigned teaching and learning roles (see section **The culture of "care"** for a complementary perspective on the dynamics of power).

Personalized practices and additional characteristics contributing to impact

By building relationships and connecting more deeply with their students, teachers provided a more personalized approach to their teaching and made more explicit the tacit pedagogical practices from their face-to-face teaching (Scull et al., 2020). This was also evident in van der Spoel et al. (2020), who provided an example of how the use of technology guided and modeled a more differentiated and personalized education that increased students' motivation. Additional factors contributing to learning and engagement in online environments included just-in-time (i.e. that responds to learners' need in a timely manner) and relevant content (i.e. precise, concise and built on key essential concepts) (Boltz et al., 2021; Scull et al., 2020).

Reflexivity on practice in the practicum

Student teachers had to rapidly adapt their practicum to the new guidelines provided by their respective teacher education programs. The literature analyzed portrays cases of practicum that transitioned into a virtual mode following the practices developed by schools (e.g. Coolican et al., 2020; Quezada et al., 2020) and other situations in which the lack of possibilities for completing the practicum forced teacher educators to rethink the ways of compensating for the practical experience developed in educational institutions (Kalloo et al., 2020; la Velle et al., 2020). In relation to the former, Coolican et al. (2020) described how the teacher candidates at the secondary education levels were able to conduct their practicum virtually, but were required to adapt their strategies and activities (e.g. project design, teaching sequences, interviews, classroom observations, evaluation, and reflection during and post-practicum) to the new mode of instruction. This situation was similar to the one presented by Quezada et al. (2020) whose course projects adapted to the new circumstances through activities that included the delivery of a digital portfolio of learning artifacts targeting the required teaching standards. This was accompanied by increased flexibility in the process, both in terms of a more holistic approach to assessment and extended the deadlines for assignments.

With a focus on assessment, Ó Grádaigh et al. (2021) described how emergency virtual observation during the pandemic facilitated an authentic insight into classroom teaching and was the preferred assessment option in comparison to other means used (e.g. professional conversations, lesson planning, portfolio and written reflections). This method also allowed timely feedback, which provided student teachers with the opportunity to reflect on the class. It seems evident, then, that a practicum in the new virtual space also required a practice-based approach with a reflective component, idea that is further explored by Kidd and Murray (2020). The educators in this study accommodated students' learning about practice, even if they were no longer in practice and, in doing so, they demonstrated how the new digital places allowed reflexivity on practice. The new spaces emerged in the absence of the practicum allowed meaningful adaptations beyond the initial emergency responses which at times exceeded the expectations of the educators.

In regards to the cases in which the irruption of the pandemic made impossible the completion of a part of the practicum, alternative forms of assessment such as the development of a teaching video with an accompanied lesson plan (Kalloo et al., 2020) and the discussion of prospective teachers' trajectory against teacher standards through online tutorials (la Velle et al., 2020) were implemented. In both cases, however, the affectation of the lockdown on the practicum was limited (two-week practicum at the end of the second semester and one-third of the practicum, respectively).

Focusing on the opportunities and challenges of online teaching placement during the COVID-19, the prospective teachers depicted by Sepulveda-Escobar and Morrison (2020) perceived their experience as an occasion to learn to work with different online platforms and to reflect on the socio-cultural context surrounding school students and their families during the pandemic. However, they highlighted the lack of direct interaction with the learners, the absence of a "live" teaching experience, their distractions in the household and the limited internet access of their pupils as important disadvantages for their teaching practice. The absence of practicum "face-to-face" experiences in the school was also an important drawback pointed out in O'Brien et al. (2020) in a study focused on physical education teacher education. In a moment when the future of school closures due to COVID-19 remained uncertain, upholding the value of school practicum in the process of learning to teach and the need for suitable modes of learning and assessment in practical-based learning subjects like physical education were considered key factors that needed to be addressed.

Fig. 1 synthesizes the main characteristics of online teaching and learning practices, including the practicum, after the outbreak of the pandemic.

Fig. 1 Characteristics of online teaching and learning practices after the COVID-19 pandemic (according to the papers reviewed).

Factors influencing impact in online teacher education

Personal and contextual elements

The literature analyzed highlighted personal and contextual factors influencing the ways in which educators and students adapted to remote education after the irruption of the pandemic. From a personal perspective, previous knowledge, skills or experience in navigating digital tools and online teaching and learning processes impacted the effectiveness with which educators and learners transitioned into the virtual modality (Ghazi-Saidi et al., 2020; Turchi et al., 2020; van der Spoel et al., 2020). In addition, Cameron-Standerford et al. (2020) found how these personal factors affected faculty's emotional responses to the crisis situation and their ability to deliver a caring but rigorous course. Different yet complementary perspectives on the effect of personal factors in the adaption to online education were provided by Cutri et al. (2020), Bařal and Eryilmaz (2021), Turchi et al. (2020), respectively. On the one hand, limited referents in terms of previous knowledge or expertise related to remote education resulted in educators experiencing further difficulties in the adaption to the new reality and adopting more traditional or teacher-centered pedagogies (Bařal and Eryilmaz, 2021; Cutri et al., 2020), either derived from the replication of previous classroom teaching (Bařal and Eryilmaz, 2021) or from the strain that the crisis situation caused on teacher educators' philosophies and practices (Cutri et al., 2020). On the other hand, Turchi et al. (2020) pointed out how despite feeling confident in their knowledge about digital tools, the participating educators in this research were exhausted by the need to consider the "digitizing" factor to their planning (p. 10).

When it comes to contextual factors, appropriate infrastructure and support were recurrent themes that affected the success of online teaching and learning practices in the virtual medium. A proper infrastructure including good internet connection or access (Coolican et al., 2020; Ghazi-Saidi et al., 2020; Ozkaral and Bozyigit, 2020; Sutiah et al., 2020), equipment (Coolican et al., 2020; Ghazi-Saidi et al., 2020; la Velle et al., 2020; Ozkaral and Bozyigit, 2020; Sutiah et al., 2020; Zapata-Garibay et al., 2021), systems (König et al., 2020; la Velle et al., 2020) and space (Zapata-Garibay et al., 2021) showed to be important to cope with remote education at both the university and school contexts. Also, support from the university for teacher educators in both senses technological assistance and adequate training for their professional development (Coolican et al., 2020; Kalloo et al., 2020; O'Brien et al., 2020; Ozkaral and Bozyigit, 2020) was key for thriving and succeeding in the new online space. These digital gaps were especially evident in public universities (Zapata-Garibay et al., 2021), where limitations in terms of internet access or technological tools prevented them from working effectively in the online environment. In addition, the analyzed literature pointed out that certain assumptions by educational institutions (Cutri et al., 2020) or limited (or lack of) family's support with the younger children (Dvir and Schatz-Oppenheimer, 2020) contributed to the digital gap. Cutri et al. (2020), for example, showed how assumptions that university students and professors all have equitable access to the needs of online teaching and learning affected the effectiveness of the educational process. Dvir and Schatz-Oppenheimer (2020), in turn, highlighted how parents' ability to support their children in learning deepened the gaps in students' achievements.

The culture of "care"

During the pandemic, the socio-emotional needs of educators and students and the responses in terms of empathetic engagement, relationship building and emotional support came to the fore. Faculty members perceived the need to maintain the rigor of their already established course objectives; however, they felt even more important to deliver a caring yet rigorous course (Cameron-Standerford et al., 2020). Examples of the literature analyzed showed how the caring dimension of teaching, exacerbated for the situation that both educators and students were going through, was naturally embedded in the process of learning to teach and became a prerequisite for thriving also in the academic dimension. Some studies show how faculty set regular meetings in small groups and/or on an individual basis to support professional and academic progress and address general concerns around well-being (Kidd and Murray, 2020; Murray et al., 2020; Quezada et al., 2020). These aimed to know how their students were coping at both personal and professional levels with the consequences of the pandemic and to provide them with appropriate support (Quezada et al., 2020).

Additional common practices that addressed students' concerns such as anxiety or isolation and contributed to a sense of belonging and community included modeling a responsive classroom through community-building activities and building relationships and connecting with the students at a social level (Metscher et al., 2021; O'Brien et al., 2020; Scull et al., 2020). Through care-based pedagogical practices, teachers provided an empowering space for both students and educators and made a positive difference for their students that tackled issues beyond their socio-emotional needs (e.g. increased students' motivation and commitment to improving their sense of confidence for a subject; willingness to try challenging tasks; engagement in aspects of learning they do not like) (Sequeira and Dacey, 2020). From a different perspective, empathetic communication at the university level also allowed staff and students to keep informed, motivated and positive (Kalloo et al., 2020).

In times of COVID-19, shared vulnerability and uncertainty between the educator and the learner influenced the dynamics of care, control and power inherent in educational relationships (Murray et al., 2020). The teacher educators who participated in this research highlighted how, by respecting distance and under the exceptional circumstances imposed by the pandemic, they modeled caring relationships and did not feel the need to control. Instead of just trying to appear professional and in control in the new online space, the participants built human and collaborative relationships with their students. Similarly, Cutri et al. (2020) described experiences of teachers sharing power in their classrooms with students whose technological skills were above their own, thereby gaining a sense of empathy for them.

Challenges in the transition to online education

Issues related to increased teaching workload, poor communication and interactivity with and between the students, and assessment of students' performance were recurrent themes that challenged the normal functioning of online lessons.

The intensification of work by educators after the irruption of the pandemic was a common topic among the articles analyzed. The participants reported increased workload (Coolican et al., 2020; Kidd and Murray, 2020; van der Spoel et al., 2020; Zapata-Garibay et al., 2021) due to: the additional efforts required to prepare and adapt their lessons and methodologies for remote learning, and; the sense of having to be available to students and families at all times and through different means (Kidd and Murray, 2020), contributing to the blurring of work-home boundaries (Kidd and Murray, 2020; Turchi et al., 2020; Zapata-Garibay et al., 2021).

Limited communication and engagement was also identified as a primary challenge in the context of online education (e.g. Boltz et al., 2021). The students described in Ghazi-Saidi et al. (2020) found it challenging to stay engaged and reported a lack of interactive activities which affected their motivation levels. Kidd and Murray (2020) also highlighted little interaction as an obstacle for impact in online education, but particularly when large group work was used in the new space. In turn, van der Spoel et al. (2020) reported limitations in terms of interaction with and between students, but also pointed out unexpected positive experience by introvert students, who were more present compared to a classroom context. Despite the availability of better tools for communication, it was clear that relationships between educators and students resented from the forced adaptations due to the health crisis (Zapata-Garibay et al., 2021). This trend was confirmed by Scull et al. (2020), who also added that while their participating student teachers may possess adequate levels of digital skills, they may lack the competences required to effectively communicate in the online environment. This concurs with Turchi et al. (2020) findings, which highlighted the lack of students' competences to support meaning making through discussion even though they were fluent in digital tools, making it clear that the knowledge of such tools may not be enough for effectively using them in the online environment.

The challenges brought by limited communication and interaction often exacerbated when student teachers did not show their faces (Turchi et al., 2020). This raised issues of attendance and presence (Turchi et al., 2020) and other ethical and moral issues. Dvir and Schatz-Oppenheimer (2020), for example, showed how the anonymity and absenteeism derived from hiding their faces allowed some learners to be verbally abusive during the sessions, forcing teachers to show leadership and responsibility to avoid major consequences. In a different sense, the limitations in terms of interaction in the online environment brought to light worries about how to monitor and assess the learning that was happening in the discussions (Sutiah et al., 2020; Turchi et al., 2020). Educators reported adjustment to new assessment procedures (Kalloo et al., 2020; König et al., 2020) (e.g. involving or limiting final examinations, respectively); however, in the transition, they also raised concerns on the need to further learn and use different forms of formative assessments (Cutri et al., 2020; König et al., 2020).

Table 2 summarizes the most relevant factors impacting online teaching and learning practices after the pandemic.

Online teacher education: implications for future practice and research

This article has provided a review of the literature on online teaching and learning practices before and after the COVID-19 pandemic. Based on earlier work focusing on the practices prior to the pandemic, an analysis was undertaken in light of the social, cognitive and teaching presence according to the CoI. Findings revealed the blurring nature of the components driving to the three presences. The ability of educators and learners to engage in relationships showed to play a pivotal role to meaningful educational experiences. At the time, its interplay with components of teaching and cognitive nature was essential in achieving teaching and learning impact.

Table 2 Factors influencing impact in online teacher education (according to the papers reviewed).

Factors	Issues included
Personal factors	• Previous knowledge, skills or experience in navigating digital tools and online educational processes
Contextual factors	• Appropriate infrastructure (internet connection or access; equipment; systems; physical space) • Support from the university (technological assistance; adequate training) • Family's support with the younger children • Assumptions by educational institutions
Caring dimension	• Regular meetings in small groups or on an individual basis to support students' emotional needs or concerns around well-being • Community-building activities and connecting with the students at a social level to model a responsive classroom • Empathetic communication at the university level to keep staff and students informed, motivated and positive
Challenges encountered	• Increased teaching workload • Poor communication and interactivity with and between the students • Assessment of students' performance

Fig. 2 Integration of the characteristics of online teaching and learning practices prior and after the pandemic (according to the papers reviewed derived).

The literature analyzed in both periods have pointed out that online teaching and learning practices that use appropriate digital tools and are accessible, authentic, collaborative, democratic, formative, personalized and integrated support impact in online teacher education environments (see Fig. 2).

The social dimension of teaching, which was found central in any online teaching and learning process before the COVID-19 crisis, was strongly impacted by the uncertainty and vulnerability generated by the pandemic. This exacerbated the caring dimension of teaching and opened the door to a more democratic approach. This caring dimension was embedded in the process of teaching and learning related to the socio-emotional needs of educators and students (Metscher et al., 2021; O'Brien et al., 2020; Scull et al., 2020), although it had an impact beyond this domain. At the time, the exceptional circumstances imposed by the pandemic and the role of the learner as a pillar for impact enhanced a more democratic perspective to teaching and learning (Cutri et al., 2020). Also, the pandemic supported the personalization of online teaching and learning, highlighting the relevance of practices that are accessible, just-in-time and relevant. Other studies have complemented this view by providing data that shows the important role of informal and self-directed learning when it comes to online educational practices (Robinson and Rusznyak, 2020; Trust and Whalen, 2020). The personalized approach to teaching and learning and its characteristics demonstrate the relevance of the online learning that is embedded in the day-to-day of educators' practices to help them tackle the challenges of the moment.

With reference to the practicum developed during the pandemic, findings from this review have emphasized the importance of providing a practice-based approach with a reflective component (Kidd and Murray, 2020), in line with Flores and Gago (2020). In addition, the perspective provided has highlighted its authentic and formative nature, and contributed with data on both the kinds of activities that facilitate reflexivity on practice (e.g. digital portfolio of learning artifacts accompanied by reflection in the process) and specific issues about how the process should be developed (e.g. timely feedback to enhance reflection after the observation of virtual classrooms). Besides activities and processes aiming to enhance reflexivity on practice, a number of options such as helping

associate teachers with technology; communicating and providing support to students virtually, and; learning new online digital platforms have been highlighted as useful practices carried out in the virtual practicum during the pandemic (Donitsa-Schmidt and Ramot, 2020; Sepulveda-Escobar and Morrison, 2020; van Nuland et al., 2020).

Although practical experience in schools is an essential component of initial teacher education programs (Allen and Wright, 2014), the above issues may be considered to address some of the constraints that many authors have associated with the emergency virtual practicum (e.g. limited contextualization; constraints of the mentoring by school teachers; absence of a live teaching experience; lack of direct interaction with the learners) (Flores and Gago, 2020; Prata-Linhares et al., 2020; Robinson and Rusznyak, 2020; Sepulveda-Escobar and Morrison, 2020). In this sense, the data provided in this article has supported the assumption that the appropriate technology and resources should facilitate a quality virtual practicum. However, more research is needed to understand how to take advantage of the affordances of technology (Moyo, 2020), as well as of the processes and resources needed to rethink traditional practicum practices and develop successful experiences in the online environment.

Contextual and personal factors impacting the development of online teaching and learning practices should not be ignored. The data derived from the analysis of the literature prior to the pandemic found that contextual factors such as limited access to technology and internet as well as differences in digital literacy that are deeply embedded in social, economic and cultural context (Beaunoyer et al., 2020), affected the normal development of teaching and learning practices and exacerbated inequalities and exclusion. The data from the post-pandemic time have confirmed these findings but have also pointed out additional issues impacting this process such as certain assumptions by educational institutions (e.g. that students and educators have the appropriate infrastructure to carry out their online learning and teaching), the support by the stakeholders involved in online education (e.g. educational institutions or families—the latter when there are young kids involved) and the limited communication and interaction derived from pupils hiding behind their cameras (see also Flores and Gago, 2020). Also, the latest findings have highlighted personal factors that need to be considered if effective online teaching and learning practices are pursued. The data analyzed has confirmed that appropriate knowledge, skills and experience in navigating digital tools and online processes by educators are needed to avoid teacher-centered pedagogies that fail to deliver an effective online education. However, it has been shown that the knowledge of such tools and processes may not be enough to ensure success in the online environment. This suggests the need to instill these practices in a comprehensive pedagogy of online education that takes into account the pedagogical possibilities associated with such digital tools and resources.

The data presented in this article has several implications for future online teaching and learning practices in the context of teacher education. First, it highlights the need to go beyond emergency online practices and provide an evidence-based approach to online teaching and learning that acknowledges the particularities of this pedagogy and its implications. This needs practices that move beyond a simplistic replication process of face-to-face format. Second, it emphasizes the need for a pedagogical approach that takes into consideration the suitability and affordances of the various technologies or digital resources to make sure that these help learners to effectively communicate and achieve the desired results in the virtual space. Also, this should acknowledge the different roles (e.g. teachers as facilitators; students as active and inclusive learners) and competences (e.g. emphasis on the social and caring components of learning) required to teach effectively in the online higher education environment (Ní Shé et al., 2019) and the nature of an online teaching and learning process that is inherently collaborative, formative, contextual, democratic and personalized. Third, it puts accent on the importance to support educators in meeting the emotional needs of their learners through acknowledging and supporting the development of the socio-emotional competences required for teaching (Hadar et al., 2020). This may include investing in high-quality teacher education programs, matching educators' current needs with professional learning opportunities, supporting mentoring, and enhancing collaboration between educators and other stakeholders involved in education, among other initiatives (Darling-Hammond and Hyler, 2020). Fourth, it points out the urgency to rely on support structures of higher education institutions in partnership with governments and organizations to achieve equity (Carrillo and Flores, 2020; Coolican et al., 2020; Sequeira and Dacey, 2020) and to move toward a more inclusive and democratic approach to learning “which empowers teachers to work on behalf of their rights and the rights of their students” (Kalloo et al., 2020, p. 461). Fifth, it highlights the importance to know how to best develop online educational experiences that are procedural in nature. For example, there is the need to understand how to take advantage of the affordances of technology (Moyo, 2020) as well of the possibilities of assessment tools in online environments (ElTahir Osman, 2020) to ensure a successful development of practical skills (e.g. those related to the practicum or other procedural areas such as Physical Education). And, finally there is a need to go beyond an instrumental approach to online teaching and learning and to include into the equation its ethical, political and pedagogical dimensions. For example, student teachers and teacher educators' roles and responsibilities in the online educational experiences and their implications for the process of learning to teach have to be considered. This also encompasses the consideration of issues of power and control over teaching and learning, i.e. elements connected with not only what and how but also who and why, which are questions that stand at the core of the development of professional knowledge and identity.

Introduction

Education is a prime mover to help nations prepare their citizens for work and life in a globalized era where the future is fraught with uncertainty. In recent times, we have been confronted with multiple crises (e.g., the Covid-19 pandemic) and disruptions (e.g., Fourth Industrial Revolution [4IR]) forcing us to rethink and change the way we live and work (Gleason, 2018). The world has also become increasingly interconnected through the affordances brought about by global cyber networks (Schwab, 2016). While the Covid-19 pandemic has revealed that our societal structures (e.g., economics, education, social welfare, finance, health) are not as robust as we thought they were, the unprecedented pace of technological advancements (Ryder, 2018) is fast causing traditional jobs to become obsolete and irrelevant. Consequently, current jobs need to be redesigned, and new jobs need to be created, and these have multiple consequences which span economic, legal, ethical and social domains to name a few (Ryder, 2018). The pace of digital transformations needed to be further accelerated in order to keep learning and working going when most were confined to their homes due to imposed lockdowns. Though the pandemic has caused many disruptions, it has also opened up many opportunities to rethink and transform our current education systems in order to cater to the new realities confronting us.

Singapore's education system has been undergoing progressive enhancements in order to ensure that its citizens will be prepared to not just survive but also to thrive in the face of an uncertain future. This article will describe the country's significant education phases since the young nation state gained its independence in 1965, broadly known as the Survival-driven (1965–1978), Efficiency-driven (1979–1997), Ability-driven (1997–2011), and Values-driven, Student-centric education phases (2011–2018). These educational initiatives outline the underpinning philosophy of Singapore's education system as being in a constant state of evolution in order to ensure both local and global relevance. Two initiatives that have gained significant traction in local and international literature are the *Thinking School, Learning Nation* (henceforth TSLN launched in 1997) and the *Teach Less, Learn More* (henceforth TLLM launched in 2005) initiatives. In 2019, a new initiative known as *Learn for Life: Remaking Pathways* (Ministry of Education, Singapore [MOE] 2019) was introduced. This new phase aims at promoting lifelong learning for both teachers and students and to relook some of the longstanding education policies such as the over-emphasis on assessments and academic streaming.

A comparative study will be made with Shanghai in China and Estonia in order to provide an insight into how other jurisdictions are rethinking their teacher education policies and programs to gear up for the global challenges faced. Finally, the article will describe how Singapore's sole teacher education institute, the National Institute of Education (NIE), an autonomous institute housed within the renowned and research-intensive Nanyang Technological University (NTU) is rethinking and reviewing its teacher education programs in order to ensure that its teachers are capable of preparing their learners to be ready for the multiple challenges and complexities of their future workplace and society.

Singapore's education phases and initiatives

Singapore's educational phases are best viewed as a continuum (Goh, 1997), where one phase builds on the success of the previous, and each phase corresponds to a particular focus in the nation's developmental journey (see Table 1).

The TSLN initiative was launched by then Prime Minister Mr. Goh Chok Tong in 1997 during the Ability-Driven phase (1997–2011). TSLN aimed to create an education system that nurtured creativity, critical thinking and a passion for lifelong learning in all its learners (Goh, 1997). This initiative complemented Singapore's economic restructuring efforts, such as creating a knowledge-based economy in order to develop a thinking and inquiring workforce. Through the TSLN initiative, Ministry of Education, Singapore (MOE) reduced curriculum content by about 30%, reviewed its assessment system, enhanced teacher training, and encouraged the sharing of best practices and ideas (Ong, 2018b; The Straits Times, 2016). From 2000, teachers received at least 100 h of professional development (PD) annually to help them grow as teaching professionals career-long (The Straits Times, 2016).

Building on the TSLN initiative, the TLLM initiative was introduced in 2005 by Prime Minister Mr. Lee Hsien Loong. TLLM aimed to improve the quality of teaching and the teaching profession, enhance student learning through further curriculum content reduction, engage learners holistically through the use of innovative learning pedagogies and equip students with lifelong learning skills. TLLM's goal was to improve learning through the improved quality of interactions between teacher and students through pedagogies that would cater to the specific needs, abilities and interests of learners so that they would be better prepared to thrive in a dynamic 21st-century workplace and society. This initiative progressed into the Student-centric, Values-driven education phase (2012–2018), and, like any other national initiative, achieved success through a fidelity in its implementation by all education stakeholders (i.e., MOE, NIE and the schools).

Learn for life: remaking pathways initiative (2019–present)

In 2019, Singapore officially launched its next education phase as the country recognized that its citizens need to be developed into lifelong learners who are positioned to face an uncertain future that is fast evolving and filled with many disruptions. The *Learn for Life: Remaking Pathways* (LfL) (MOE, 2019) education phase builds on previous iterations of lifelong learning initiatives amid the massive changes in the local and global jobs sector, technological advancements and new ways of learning and working.

Table 1 First four education phases of the Singapore education system (Heng, 2015; Low, 2017; NIE/NTU, 2017; The Straits Times, 2016).

Education phases	Main features
Survival-driven (1965–1978)	- Aimed to reduce high school dropout rates and to raise school participation and enrollment rates by building primary and secondary schools, doubling enrollment rates from 1965 to 1970 - Developed a national curriculum and introduced the primary school leaving examination (PSLE), a national high-stakes examination that provides the academic pathway for entry into secondary education
Efficiency-driven (1979–1996)	- Carried out the recommendations made by the Goh Keng Swee report of 1979 to improve the education system - Aimed to reduce the high drop-out rates of students with differentiated academic streams being introduced at primary 4 and secondary 1 respectively - Developed the 6-4-2 education system (6-year primary, 4-year secondary and 2-year pre-university) as the default route with extended pathways possible - Instituted English as the medium of instruction (MOI) in all Singapore schools in 1987 - Established independent schools that gave schools greater autonomy - Standardized curriculum and assessment with all learners taking the PSLE, and the GCE O- and A-levels for entry into secondary, pre-university and tertiary education
Ability-driven (1997–2011)	- Focused on the development of every child to reach his/her fullest potential - Launched TSLN in 1997 - Launched TLLM in 2005
Values-driven, Student-centric (2011–2018)	- Integrated both the Ability-driven and the Values-driven, Student-centric phases to serve as the foundations for the Framework for 21st century competencies and student outcomes (MOE, 2018a) - Ensured that academic and life skills, values and character development in students were taught in schools while considering the diversity of learner abilities and talents - Envisioned all learners to be developed into confident persons, self-directed learners, active contributors and concerned citizens - Equipped students with the values, beliefs, character, knowledge, skills and competencies necessary for the 21st century

Then Minister for Education, Ong Ye Kung introduced LfL in 2018 and posited that lifelong learning is “a value, an attitude and a skill that our students need to possess, and it is fundamental in ensuring that education remains an uplifting force in society” (Ong, 2018a, para. 17). Skills and content are still important as Ryder (2018) observed, but they are only “the icing on the cake”; rather, the more important attribute is the aptitude for lifelong learning that must be underpinned by “strong cognitive skills, such as literacy and numeracy” (para. 9). Lifelong learning has become the principal consideration of the Singapore education system to help students to be “resilient, adaptable and global in their outlook”, who “must leave the education system still feeling curious and eager to learn, for the rest of their lives” (Ong, 2018a, para. 22). The system also recognizes that all learners go through different stages of learning, where each stage requires a significant transition and pupils need an adequate runway to adapt to the new demands. Thus, a further diversification of education pathways was introduced. This initiative also introduced subject-based banding (SBB), where academic streaming is abolished in favor of banding by subjects, a reduction of overall assessments across different levels of study and an urgent push to recalibrate the balance between upholding academic rigor while still igniting the joy of learning in all students.

Comparisons with Shanghai, China and Estonia

Singapore’s education transformation efforts are compared with Shanghai, China and Estonia. Shanghai, China was chosen because it is based in Asia, just like Singapore, and Estonia was selected as a jurisdiction that has had a sharp rise in its educational rankings as measured by the Organization for Economic Cooperation and Development (OECD)’s internationally benchmarked test of student achievement, the Program for International Student Assessment (PISA). All three jurisdictions have fared well in the PISA 2018 study with China (represented by Beijing, Shanghai, Zhejiang and Jiangsu) topping the league table for achievements in Reading, Mathematics and Science, Singapore emerging second in all three areas, and Estonia emerging top five for Reading and Science.

Differentiated instruction (DI)

The concept of DI will be explored via the various approaches taken by each of the three educational jurisdictions. It is important to first articulate what our understanding of DI is. Tomlinson (2005), credited with being a leading scholar in the field, defines DI as “a philosophy of teaching that is based on the premise that students learn best when their teachers accommodate the differences in their readiness levels, interests and learning profiles.” The main objective of DI is to ensure that every student’s learning potential is maximized. In terms of DI strategies, Singapore introduced full SBB, Shanghai China employs the Shanghai Mastery Approach, and Estonia’s education system is focused on providing equal opportunities for all and ensuring that an individual’s lifelong development is taken care of. Each of these approaches will be further elaborated upon.

Singapore’s SBB aims to meet the learning pace and needs of each student and to challenge them at academically appropriate levels (Chan, 2019). While all primary schools are already adopting the SBB system, secondary schools will embrace full SBB by 2024. SBB is meant to take the place of academic streaming that was introduced in the 1980s. In the early post-independent years, the academic streaming system was introduced to solve the issue of high student attrition rates by providing each student with an academic stream that is positioned to match their learning abilities and pace. Learners were placed in one of three academic streams as early as the upper primary level and continues to the secondary level of schooling. These academic streams do not take into account an individual’s talents or achievements in particular subjects since the stream determines the overall structure and duration of one’s academic program. It was, however, possible for a student who performed well to switch academic streams if they performed well in a particular year of study. Academic streaming has achieved its overall objective to decrease student attrition rates (Tan, 2019), however, the designation of an academic stream that is based solely on academic performance has the inadvertent effect of making less academically able students feel less confident about themselves.

SBB is introduced as an enhancement and a viable alternative to the longstanding academic streaming system as it focuses on students’ strength in individual subjects. Students are placed into one of three bands within each subject, namely, G1, G2, G3 which are customized to suit their learning abilities and aptitudes, thereby enhancing student performance through motivating each learner to learn according to their interest and aptitude in each subject (Wang, 2019). Chan (2019) expressed that SBB helps cater to the “Seven S” elements of education, namely, “specific abilities, suitability, self-concepts, stigma, student-centric schools, societal attitudes and subjective well-being.” The pedagogical customization of SBB considers the specific abilities of a learner, the student-subject match, improves students’ self-confidence, removes the social stigma associated with academic streaming, shifts societal attitudes from the ability-driven to a growth mindset (an essential element of lifelong learning), and protects the well-being of students from academic-related mental stress. While skeptics have terms SBB as placing “new wine in old bottles,” Chan argues that when students’ learning encounters are positive, “students experience high subjective well-being, which results in higher motivation, better performance and more pro-social behaviors.” This will eventually enable students to lead successful and fulfilling lives and allow them to function effectively both independently and interdependently as they enter the society and workforce in the future.

Being one of the four regions that participated in PISA 2018, Shanghai (with Beijing, Jiangsu and Zhejiang being the others) presents an interesting point of comparison as it is also considered the financial hub of China. The Shanghai Mastery Approach is one where a whole classroom learns a single concept in depth through the use of standardized textbooks and does not proceed to the next concept until every student has understood it (Neha, 2017). Classes are repetitive and progress slowly with each lesson, allowing teachers to correct learners’ mistakes and misunderstandings. While the approach primarily focuses on Mathematics, its

principles are also applied in the learning of languages, science and the humanities, especially in the early years to level up those who had a disadvantaged start to their education (Williams, 2019). Teachers possess the belief that all children are capable of learning anything if learning is presented in a precise manner. It therefore caters to disadvantaged students while reinforcing fundamental concepts in the academically more able students.

The constraint of such an approach is in the need for high-quality teachers to successfully implement this approach in a class of learners with mixed prior knowledge. All teachers need to be masters of their subjects and pedagogical practices, and they teach a specific subject and only that subject (Neha, 2017). The success of this approach is further hinged on the teacher's ability to simplify and scaffold learning and to constantly manage progression, assessments and maintain consistency while avoiding differentiation in instruction (Newell, 2019). This approach has its advantage by addressing the negative stigma of being a low progress learner (noted in Singapore's academic streaming system) as the whole class must understand the concept before lessons may progress to the next topic. A low progress learner is not isolated for differentiated instruction as the teacher has to ensure that the entire class has mastered a particular concept before moving on to the next topic. As the achievement gaps are tightened in the early years, the need for differentiated instruction becomes non-consequential. Interestingly, the Mastery Approach has been adopted by the United Kingdom in the teaching and learning of Mathematics in some primary and secondary schools (Boylan et al., 2018).

Described as one of the newest international education powerhouses (Butrymowicz, 2016), Estonia is on the upward trajectory, as evidenced in the PISA 2018 results. Estonia's education goal is embodied in their Lifelong Learning Strategy which provides everyone in Estonia "with learning opportunities that are tailored to their needs and capabilities throughout their whole lifespan, for them to maximize opportunities for dignified self-actualization within society" (Ministry of Education and Research, Estonia 2014, p. 3). The Estonian education system is rooted in its quest to provide equality for all, its philosophy of student readiness and individual development for life. Favoring a teacher-centered, learner-supported strategy, Estonia focuses on content more than soft skills (Hatch, 2017). In approaching customized learning and differentiated instruction, it adopts a two-pronged approach to support all learners through development-appropriate learning and individual development plans, thereby raising the achievement of all learners through equal learning opportunities. Moving from age-appropriate to development-appropriate learning aids, individual learners progress to a level that suits their pace of development.

In the Basic and Upper-Secondary Schools Act (Teataja, 2013), teachers are required to monitor the development of learners and adjust instruction and/or learning activities to help students cope with the demands of their academic progression and achievement levels. The Estonian Ministry of Education prescribed that all students must have an individual conversation with a teacher in each academic year to help them develop an individual developmental plan. The goals and means to get to the goals are discussed and the teacher serves to guide, coach and monitor their students' development. This purpose-driven conversation inculcates ownership toward learning and the emotional support rendered by teachers provides students with a safe and nurturing environment to cope with the rigorous demands of academic work. Since most teachers teach the same students for at least three years, they develop strong bonds and can cater their lessons to meet their student's ability without the need to academically stream them by classes. The sense of ownership is very strong within the teaching fraternity (European Agency for Special Needs and Inclusive Education, n.d.). The Estonian individually customized approach stands in contrast to Singapore's differentiated instruction by subjects and Shanghai's mass mastery approach.

Assessments for and as learning

Assessments for and as learning play important roles in teaching and learning by helping students to become self-directed learners who can engage in lifelong learning. Hence, assessments must be enacted with a clarity of purpose, thorough planning and careful implementation in order to provide teachers and learners the appropriate feedback to address gaps in learners' understanding.

In Singapore, the reduction in the emphasis on school-based assessments was introduced in 2018 by former Education Minister Mr. Ong Ye Kung at the MOE Schools Work Plan Seminar. He announced the removal of all weighted assessments for Primary One and Two to allow young learners time to experience the larger school environment, nurture their inquisitiveness, develop mastery in fundamental literacy and numeracy, and to encourage the holistic development of the youngest students in the formal school system (Ong, 2018a). This initiative is backed up by research evidence in child development where the reduction of testing in the lower primary years helps to build executive functioning skills, self-regulation and a growth mindset, which in turn can help develop learners' lifelong learning dispositions (Devine and Hughes, 2014; Portilla et al., 2014). The use of formative assessments rather than mid-year and end-year summative assessments helps to build confidence in young learners where the assessment rubrics and developmental goals guide learners toward attaining mastery in literacy and numeracy skills. Moreover, young learners develop an intrinsic motivation to learn through constant progression and mastery of developmentally appropriate literacy and numeracy skills (Reeve et al., 2018). The removal of mid-year examinations in the transitional schooling years of Primary Three and Five, and Secondary One and Three was also announced (Ong, 2018a). The reduction on the number of examinations is meant to recalibrate the over-emphasis on assessments and to allow students to discover the joy of learning and for teachers to adapt to the different learning dispositions of each student.

Echoing the reforms in Singapore, alternative assessments to develop students holistically (Tan and Ng, 2018) have been advocated by educators since 2014 in Shanghai, well-known for its stressful *Gao Kao* (university entrance examinations). Grounded on the principle to "uphold quality-oriented education and focus on students' moral, intellectual, aesthetic and all-round development" (Shanghai Municipal Education Commission, 2014), Shanghai's assessment reforms are well-received as educators see that the refinements will holistically equip students with an international outlook. This assessment reform may be seen in their "educational appraisal", a variant of formative assessment which includes more formative assessment elements and provides

teachers with the opportunities to provide more qualitative feedback. This stands in contrast to conventional summative assessments that provide limited quantitative feedback opportunities. To alleviate examination-related stress, Chinese students can sit for their foreign language papers twice. However, the adoption of alternative assessments is not uniform throughout Shanghai and will need time to be scaled up.

For a country that is a forerunner in Science, Technology, Engineering and Mathematics (STEM) education and has a high proportion of female graduates entering into technology-related sectors, Estonia adopts a fairly conventional assessment system. However, it is interesting to note that assessment results are seen as proxies of student readiness for progressing to the next stage in education. Student readiness is gauged by national examinations, sampled-based examinations, and regular classroom formative and summative assessments. Satisfactory levels of attainment must be obtained by students in curricular subjects and creative work in order to qualify for graduation. Every student undergoes a mandatory yearly developmental interview and schools are held accountable designing appropriate interventions to level up students with unsatisfactory year-end performance. With its robust and free pre-primary school program, 6-year-olds' readiness is assessed via a primary school readiness evaluation before they enter primary school. With the exception of school-leaving assessments that are highly stressful, students are tested only once every three years; other national assessments in elementary and lower secondary schools are strictly sampling tests that are to provide schools, districts and the Ministry a gauge to students' learning and to help guide policy formulation and planning (Ministry of Education and Research, Estonia 2019).

A national framework for teaching and learning

In conducting a literature survey of China and Estonia's education systems, a national-level framework for teaching and learning was not found equivalent to what has been articulated within Singapore and named the Singapore Teaching Practice (STP) (MOE, 2018b). It should be noted, however, that Singapore is a small country with a population of about 5.69 million (Department of Statistics Singapore (DOS), 2021) with a stable political system where the ruling party has been in power since 1965. This allows for policies to be enacted quickly system-wide. Even within Singapore, there exist a few different education frameworks developed. The STP, which is co-developed by MOE and NIE aims to serve as a framework to "develop our teachers, codify our practices, and document the perspectives and practices that support our educators in facilitating learning within and outside the classroom" (Liu and Lim, 2018, p. 6). It details how effective teaching and learning practices are achieved in Singapore classrooms. According to MOE's Director-General of Education Mr. Wong Siew Hoong, STP is "the reference point for us to examine our own professional practice, think deeply about it and improve it, in all the different aspects of the work that we do" (Chan, 2017, para. 2).

Schematically represented by the country's national flower the orchid, the STP (See Fig. 1) is anchored by the Singapore Curriculum Philosophy (SCP) and articulates Singapore educators' beliefs about teaching and learning, and the roles of learners. At its core are Pedagogical Practices (PP, see Fig. 2) which reflect key teaching processes that guide teaching actions to ensure that every student is an engaged learner. The teaching processes are divided into 24 teaching areas that are taken into consideration when

Fig. 1 The Singapore teaching practice (MOE, 2018b).

Fig. 2 Pedagogical practices (MOE, 2018b).

planning, enacting and reviewing effective lessons. PP is informed by three Knowledge Bases, namely, understanding subject matter and goals, understanding students and learning, and understanding teaching. The knowledge bases are drawn from both local and international research, which provide the evidence-base for contextualized local practice.

The components of STP “are situated within a larger ecosystem that supports teachers in developing and deepening their craft as competent professionals, collaborative learners, and transformative leaders” (Liu and Lim, 2018, p. 6). A course, entitled Pedagogical Practices (PP), introduces student teachers to the “why, what and how of teaching” and prepares student teachers for their clinical practice component, the teaching assistantship. The PP course provides pre-service teachers a clear link between theory and practice and takes place concurrently during their teaching assistantship where student teachers spend a day on campus and four days out in school. The four teaching processes in the STP are part of the assessable components of the clinical practice stints for pre-service teachers. In-service teachers are provided with PD workshops and courses to help them to mentor novice teachers using the same STP framework so that a common language exists across the continuum from pre-service to beginning teaching. This common framework is envisioned to help teachers across their career-span to “continually reflect on their roles, draw upon theories and research to deepen their understanding of learning, think systematically about their practice, and adapt their teaching to support their students’ learning” (Liu and Lim, 2018, p. 6). An online STP portal was also developed and provides a digital repository of relevant studies for each teaching area to reinforce and amplify good teaching practices that is backed by empirical local and international research evidence.

While having a national framework is an advantage in providing a clearer picture of how teaching and learning may be effectively achieved and in helping to provide a common pedagogical meta-language between key stakeholders, there is much to be learned from Shanghai’s mastery approach and Estonia’s personalized learner-centric approaches earlier described. Students from these systems are reported in newspaper interviews with school leaders and teachers (Blatchford, 2015; Hatch, 2017; Kangur, 2018) to be joyful, engaged learners and this intangible achievement is supported empirically by results of the PISA 2018 survey (OECD, 2020a,b).

Balancing academic rigor with inspiring the joy in learning

Based on the latest PISA 2018 findings, 59% of Chinese students surveyed and 70% of Estonian students reported being satisfied with their lives, with the OECD average being 67% (OECD, 2019b). 98% of Chinese students and 89% of Estonian students reported being happy sometimes or always happy. Interestingly, Shanghai students seem not to indicate pressure faced via the Mastery Approach (Blatchford, 2015). Once students can understand the lesson, the strive toward high performance is reported to be satisfying for both teachers and students. While Estonian students are reported in the PISA 2018 results to be happy with their lives, in a qualitative survey, a principal voiced concern that learners and teachers may not be happy (Kangur, 2018). To address this

concern, Hatch (2017) describes a project that gives learners autonomy and choice about how they want to spend their leisure time and to further develop their system of hobby schools and providing youth with work opportunities has been undertaken. The results about the well-being of the Singapore students were not listed in the PISA 2018 results. While it should be noted that well-being is a “multi-dimensional construct and that its measurement requires covering different domains, not just overall life satisfaction” (OECD, 2019b, p. 261), it should also be recognized that the different domains are interrelated and the PISA 2018 surveys “connect school life with the broader ecosystem in which students live—the family, their peers, the community—and provide information on the development of 15-year-old students” (OECD, 2019a, p. 47).

Singapore’s policymakers are keenly aware that academic success does not necessarily equate to positive holistic development. Then Minister of Education in 2018, Mr. Ong Ye Kung announced that “a balance [is needed] between rigor and joy, and there is a fairly strong consensus that we have tilted too much to the former” (Ong, 2018a, para. 31). He further commented that “education in schools is at risk of becoming too stressful and maybe some unwinding is in order” (Ong, 2018a, para. 8). Singapore is considering three initiatives in an attempt to rebalance the overemphasis on assessments with bringing out the joy of learning.

First, through the TLSN and TLLM initiatives curriculum content had already been reduced. What is currently the focus in the LfL initiative is to reduce the emphasis of studying to the test via the reduction in overall number of examinations in non-final years of study as mentioned earlier (Ong, 2018a, para. 36). Second, curriculum time should be focused on better teaching and learning activities, rather than more drill and practice (Ong, 2018a, para. 37). Singapore could study how Shanghai’s Mastery Approach manages to instil the joy of learning while upholding academic rigor. Third, the reduction of school-based assessment loads by 25% signals to Singaporean students and their parents more time is released to help nurture more creative and innovative thinkers. In tandem, pre-service teacher preparation programs have to be reviewed and enhanced to align with the national education initiative. This will be described in the next section of this article.

Preparing future-ready teachers for future-ready learners

The concept of future-readiness has taken on a whole new dimension in recent pandemic times because every education system is struggling to keep teaching and learning going in the midst of school closures and national lockdowns. Nurturing students who are future-ready requires equipping teachers with the attributes to help their students to prepare for a complex and uncertain future.

The envisioned attributes of future-ready teachers are boldly articulated in Singapore’s vision for teacher education as being creators of knowledge, facilitators of lifelong learning, architects of learning environments, shapers of characters and leaders of educational change. To elaborate, future-ready teachers should be:

- Active knowledge creators of content and pedagogy, adding new value to the professional teaching fraternity
- Facilitators of lifelong learning
- Architects of learning environments and active agents in curating the best physical and virtual learning spaces for their learners
- Shapers of characters who possess the values and moral fiber to cultivate sound values and develop their learners to be good and useful local and global citizens
- Leaders of educational change from within their classrooms emanating to the school and systems level

These attributes are pivotal in the uncertain era where the citizens of a nation must have “an aptitude to lifelong learning” (Ryder, 2018), combined with thinking minds that are “agile, flexible and cooperative” (Gleason, 2018, p. 165). The next section describes the main program components that enable Singapore to work toward its vision of providing a forward-looking teacher education program.

Main program components

Fig. 3 shows the main components of Singapore’s pre-service teacher education program viz. building teacher professionalism, designing and enacting rigorous programs, using innovative pedagogies, providing multiple perspectives and deepening professional practice.

Teacher professionalism

Singapore’s values-based education framework (Fig. 4) is premised upon the expanding environment framework which begins with the individual “myself” emanating to “my community”, “my nation”, ending with “my world”. Accordingly, the courses offered also fall within each of these concentric circles of influence. Of significance is the SPINE of the expanding environment values education framework which is about “character and citizenship education” which helps our students to be good and moral citizens of our nation and ultimately, active, ethical and positive contributors to the world as global citizens.

In each respective sphere of influence lies programs and initiatives that endeavor to build values in our students.

- **Myself:** Pre-service teachers undergo a personal and professional development journey via the Meranti project which is named after a strong and resilient tree symbolizing their deep commitment to teaching, learning and building the future of our nation.

Fig. 3 Program components for preparing future-ready teachers.

Fig. 4 Expanding environment approach in values-based education.

- **My Community:** All our student teachers undergo a mandatory community involvement project known as the “Group Endeavors in Service Learning” which helps them to work with a community partner of their choice and to serve that community through meaningful engagement.
- **My Nation:** Our students take the “Singapore Kaleidoscope” (SgK) course which uses appreciative inquiry as a pedagogical approach for our students to appreciate the diversity of our culture and heritage. The Multiculturalism course: “Appreciating and Valuing Diversity” also helps our students to appreciate Singapore as a multilingual, multi-racial and multi-cultural society.
- **My World:** Students are given multiple global experiences through semester exchanges and the international practicum components. Additionally, the post-pandemic world calls for a re-thinking of the archetype of the future-ready teacher who is able to thrive, survive and prosper in a highly volatile and uncertain world.

Rigorous programs

As a university-based teacher education program, Singapore needs to ensure a tight theory–practice nexus. This is done mainly by getting student teachers to do multiple reflections, via experiential learning, embarking on school-based research and inquiry-based projects focusing on problems of practice, enhancing the practicum stints such that there is coursework linkage via the PP course earlier described, and other pedagogical tools that allow classrooms to be virtually brought into the university. A program that provides a good showcase of the rigorous components of the pre-service program is the premier Teaching Scholars Program

(TSP) (NTU, 2019; OTE, n.d.) which endeavors to nurture teachers who will eventually have the potential to be leaders and movers of the education system, the core features of which will be described under the other program components. TSP scholars are also given the privilege of participating in the Undergraduate Research Experience on Campus (URECA) research projects where they supervised by any faculty within the university and aimed at inducting undergraduates to presenting their work at international conferences and to co-publish their work in reputable peer-reviewed journals.

Evolving pedagogies

The pre-service program adopts five pedagogical approaches to help nurture future-ready learning outcomes:

- (a) Active learning to foster a spirit of enterprise and discovery and to allow one to engage in lifelong learning through teaching and research
- (b) Appreciative inquiry where student teachers develop a greater appreciation for the subject matter at hand. For example, in the SgK course, student teachers explore and appreciate Singapore's nature and biodiversity, cultural heritage, and its position in the world. The course is assessed through producing an artifact that showcases student teachers' appreciation of local culture and heritage
- (c) Collaborative learning, where knowledge is co-constructed and facilitated by the collaborative classroom infrastructure in all tutorial rooms and virtual collaborative spaces
- (d) Flipped learning, where content is delivered asynchronously and synchronous sessions are to engage in discussion and to clarify any misconceptions
- (e) Mobile learning (or mLearning) both through the use of mobile devices and applications customized for their learning and supported by a digital library of resources for ready access anytime, anywhere

Multiple perspectives

Pre-service teachers are provided multiple local and global experiences via their local and international practicum stints, semester abroad exchange programs, local and international internships, service-learning, and leadership training opportunities.

Professional practice

The Professional Practice and Inquiry (PPI; NIE, n.d.) course is conceptualised as a digital portfolio and is designed as a learning portfolio whilst at pre-service, allowing student teachers to integrate and aggregate their learning. While serving as a showcasing portfolio about what they have learnt at pre-service during their clinical practice in schools, it is also meant to be their professional teaching portfolio when they step out into schools as novice teachers. The digital portfolio is a means to help student teachers track their growth, experiences, and developmental journey. The digital portfolio is learner-centered and gives student teachers agency and ownership over their learning. The latest iteration has learning analytic capabilities built in and offers more digital collaboration opportunities.

Teacher education in pandemic times and beyond

The Covid-19 pandemic has severely impacted the lives of individuals and societies around the world. Like many nations world-wide, there were school closures amid a national lockdown in Singapore. Singapore termed its lockdown the Circuit Breaker period from 7 April to 1 June 2020. All pre-service on-campus classes and laboratory sessions went 100% virtual and had to be delivered via online platforms like ZOOM or TEAMS. All final written examinations for non-final year student teachers were canceled with assessments re-scaled based on what had already been submitted during the course as part of formative assessments.

The Teaching Assistantship (TA) and the Final Teaching Practice (Practicum) for several hundred student teachers also had to take place in a remote, home-based learning (HBL) environment. When the circuit breaker was implemented, final year pre-service teachers had only completed five and a half weeks or 55% of their practicum on-site in schools. Their remaining four and a half weeks or 45% was completed virtually via HBL and this mixed-modality approach while proving to be highly challenging had also underscored the importance of tweaking the practicum assessment components to include the successful enactment of a virtual lesson.

Conclusion

This paper described the evolutions in Singapore's education system and attempted a comparison with two other jurisdictions with outstanding performances in the PISA 2018 surveys. It has also documented recent efforts to design and deliver a teacher preparation program that endeavors to prepare teachers capable of nurturing lifelong learners who are able to thrive in the context of a complex and uncertain future. Concrete examples of how the program had to respond to the pandemic during a national lockdown were also provided.

Reimers (2018) argues that education and schools must be designed to help individuals to develop their full potential, face the ever-evolving challenges of the future, and prepare our young to be equipped with the necessary and relevant attributes, skills, and competencies to live fruitful and fulfilling lives. As we find ourselves confronted with one of the most complex biological crises of

humankind that shows no sign of abating, it has become clear that the role of all educators around the world is to keep learning going no matter what, no matter when and no matter how. Such is the huge responsibility that rests with all teachers and the even more urgent mission confronting us is how we need to redesign our teacher education programs to adequately prepare our teachers to fulfill this essential role.

Education reforms instituted to meet neo-liberal agendas were adopted by several countries across the globe via processes of internationalization and policy borrowing. While policy texts in India of the mid-1980s (GoI, 1985a,b) underscored the agency of the teacher and the child; the sub-text of the discourse alluded toward reforms based on major shifts in economic policy. Initiated in the mid-1990s reforms were explicitly designed to meet the demands of shifting the aims of education from nation building and emancipation to global economic competitiveness and human resource development. A convergence between the neoliberal focus on skills and employability, and a behavioristic outcome-based model of education reshaped classroom practice. Cultures of performativity replaced the idea of teacher agency with prescriptive curricula and uncompromizing regimes of testing.

A decade later, the National Curriculum Framework (NCF) (NCERT, 2005) for school education in India, had the potential to reposition teachers as agents of educational change and social transformation (Batra, 2006). Even so, policy measures favored testing regimes over teacher support interventions, widening the gap between teachers and school curriculum. Despite a progressive school curricular discourse, precious little changed in the social ethos of preparing teachers. The view of teachers as “state implementing agency”—a role continuity since colonial India—continues to dominate policy thinking; and classroom practice is shaped by teachers whose work and worth is judged within a neo-liberal frame (Batra, 2014), that is now converging with a discourse around religio-cultural nationalism.

Shifts in curriculum policy in several countries, argue Priestley et al. (2015, p. 1) “heralds a [re]turn to the centrality of the teacher in school-based curriculum development.” In India the emphasis on teachers in addressing issues of quality can be seen in the rhetoric of redesigned schemes of universalizing elementary education (the *Samagra Shiksha Scheme* was initiated by the Government of India (2018) to improve quality of school education with an explicit emphasis on teachers, bringing under one umbrella, three central government schemes: SSA, RMSA and CSSTE). Scholars however, argue that there is very little latitude for teachers to exercise agency in real classrooms (Batra, 2005; Long et al., 2017). As the primary vehicle to implement politically mandated school-based reforms, teachers are often made partners in taking forward policy agendas and measures that undermine their individual and collective agency. The turn of policy discourse toward the centrality of teachers needs to be seen in this light and examined critically. This is especially so as several non-state and global actors step in to tell teachers what to do in classrooms. A recent study examining the impact of the pandemic and resultant school closure highlights how teachers are being left out of core decisions and processes of educational practice, undermining their potential role in ensuring quality education (Batra et al., 2021).

There is every reason to be skeptical about the renewed emphasis on teachers in India and elsewhere. The current policy focus on teachers is not very different from existing global discourses on teachers that have acknowledged that “teachers matter” (OECD, 2005) and the “centrality of effective teachers” (Barber and Mourshed, 2007). Global teacher governance frames, argues Robertson (2012) shift “sovereignty and authority away from the nation and the teacher, to the global and global actors” (p. 23).

Given this, the important questions are: whether the emphasis on teachers in the policy space can indeed be used to reinvent the idea and practice of teacher agency; and whether agentic teachers can disrupt status-quo and enhance their professional role and self-governing space?

In an attempt to examine the potentiality of teacher agency in “reclaiming” and “restoring” the rightful space for teachers in education and society, the paper engages with: the impact of educational reforms in India; key theoretical propositions of teacher agency; and how learning experiences can be designed to cultivate teacher agency. Education reforms around the teacher in India - driven by forces of liberalization and the post-Jomtien (EFA movement launched in 1990) pressures of an international community—and their impact are discussed first. Subsequently, key theoretical propositions of teacher agency are revisited to ascertain their feasibility in the contemporary Indian context. In the third section the paper presents the proposition and an argument that learning experiences can be designed to cultivate in teachers the potential to act individually and collectively. The argument developed is substantiated and authenticated by the processes identified in a teacher's personal narrative, a summary adaptation of which is presented as well.

Economic, social and political context of education reforms in India

A slew of reforms instituted by the Government of India (GoI) in the mid-1990s with World Bank support (District Primary Education Program) continued under the *Sarva Shiksha Abhiyan* (SSA) launched in 2003. With focus on textbook development and pedagogic renewal, nation-wide reforms led to isolated attempts at transforming the capacity and role of teachers. SSA enhanced school access to meet the goal of universalizing elementary education. Quality of education however, remained a concern. Several survey reports (ASER and NAS) indicated that precious little was achieved in terms of learning outcomes and in reducing gender and social inequities. This attracted a range of private players to occupy the educational space left vacuous by an unimaginative state school system.

Donor-driven reforms began with a stated focus on the child as active learner and the teacher as the object of reform. The key premise on which the process of pedagogical renewal was designed included addressing “student deficit” via remediation and compensatory education. Intervention focused on designing activity-based textbooks and training teachers to translate imported and abstract ideas of “child-centered education” in state schools. In the absence of adequate theoretical engagement due to impoverished teacher discourses, local interpretations of concepts related to “child-centered education” diluted most attempts to establish any serious discourse on praxis among teachers. It was no surprise that these new ideas could not take root in a school system that was highly bureaucratized with an emphasis on “delivery” in which the teacher was seen as mere implementer. Stagnant learning outcomes for over a decade could to some extent be attributed to misplaced ideas of educational reforms that in effect undermined teacher agency and failed to do justice to the agency of the child in the everyday classroom, in spite of mouthing child and teacher-centric platitudes.

In the absence of any noticeable change in classrooms and learning levels, several studies commissioned by the World Bank and other donor agencies built a national narrative around teacher absenteeism and teacher incompetence (Batra, 2017a). The need to examine and address the professional needs of teachers and their qualification was discounted. A simultaneous set of researches led to the overwhelming view that school teachers were highly politicized and large proportion (over 90%) of the education budget spent on teacher salaries brought very little returns (Kingdon and Muzammil, 2009). These studies became the basis of the policy trajectory during the third decade of liberalization in India. Compelling economic arguments resulted in crystallising the idea of “para teachers” (a generic term applied to school teachers appointed on contract basis, under varying service conditions) who were hired, sometimes at less than one-third the cost of a regular teacher’s salary. A spate of researches supported the argument that lowering teacher costs is necessary to achieve quality education for all (Muralidharan and Sundararaman, 2013; Atherton and Kingdon, 2010). Several reform measures emerged from the widely held view that elementary school teachers require minimal investment in terms of professional development and support.

This led to emasculating the school teacher; who was increasingly talked about as *the* object of reform rather than a partner in enhancing the quality of school education. Reform measures kept teachers away from critical decisions and processes of curriculum design, pedagogy and learner assessment. Viewed as “lacking” in the progressive discourse of “child-centered” education; teachers were made mere receptacles of imposed ideas that related neither to their pre-service education, nor to the prevailing realities of state classrooms. Divested of intellectual agency, school teachers felt increasingly alienated from their own work. As agents of the state they had little choice but to become complicit in bureaucracy-driven reforms. Public opinion about teachers reached an all-time low fomented by an anti-teacher discourse and state assault on the educational space and work of teachers.

While economic liberalization since the early 1990s pushed for opening up the educational space to the market; the curricular policy discourse via the NCF, 2005 brought renewed focus on the role of the state in maintaining pluralism and diversity of knowledge; seeking participation of teachers in designing textbooks and creating democratic spaces of learning. Though the NCF focused on altering the perspective and content of school curriculum, its expectations of the teacher’s role continued to be largely prescriptive and often contradictory. The NCF advocated constructivist pedagogic approaches, positioning the child at the center of curricular change. However, it undermined the criticality of the teacher in translating its vision in real classrooms. The principles that guide the perspective of the NCF—such as connecting knowledge to life outside school, enriching curriculum beyond the textbook and nurturing identities within the democratic polity of the country—could not be realized in the absence of proactive engagement of the school teacher (Batra, 2005, 2016). Empirical research bears testimony to this argument (Dalal, 2015).

In not addressing the teacher as central to learning, the NCF could do little to counter the anti-teacher discourse or to resist inflexible measures of accountability that defined the worth of teachers’ work in isolation of systemic context. It was no surprise that the Right to Education Act (2009) maintained a studied silence on who should be a teacher; but included the use of punitive measures against “teachers” who fail to “perform” (GoI, 2009, p. 8, 46).

Inadequate focus on teachers in instituting curricular reform; and the increasing wedge between the curricular discourse and neo-liberal policy measures of teacher accountability and large-scale testing took away the legitimacy of policy engagement with classroom processes. Deep penetration of the market in the education sector coincided with the entry of the corporates to alter the very purposes and processes of education. Elementary education began to be seen as the site for skill development and vocationalization to serve the needs of industry, now legitimized through the National Education Policy (GoI, 2020).

The most significant fall out was that “altered purposes” of education no longer required a teacher who could bring “professional judgment” to the task of teaching. Teachers were being “told” what to do and how. Edu-preneurs exploited the opportunity to market blue-prints of lesson plans—for profit, which schools implement with little regard to the contexts of learners, teachers or the school (Kamat et al., 2016).

Mirroring the colonial frame, schools and teachers as state agents appear to work together to perpetuate ideologies that preclude schools from becoming sites of contestation, debate and meaningful learning. With the gradual withdrawal of the state and the expansion of local and corporate schools, a new nexus, a new narrative and educational practice emerged. This is predicated on the lack of teacher agency and their complicity in maintaining status-quo. Relying on “normative assumptions” about learners in a diverse society, teachers tend to undermine the intellectual capacities of students from disadvantaged communities; exclude their narratives from spaces of learning (Avalos, 1986; Batra, 2017a) and rarely create learning experiences that foster critical consciousness about social inequities and systems of oppression as argued by several critical theorists (Freire, 1970; Giroux, 1986; McLaren, 2015).

Accounts of teachers’ work in select state schools reveal how the “diminished professional role of teachers has undermined their agency and ability to practice critical pedagogy for educating the subaltern classes” (Majumdar and Mooij, 2012, p. 33). Given the understanding that teachers’ voices are often silenced within the hegemonic discourse of reforms that undermine their agency, the question—whether teachers can indeed disrupt status-quo; reclaim and restore their place to empower students—becomes central to any advocacy for teacher agency. This question also becomes important in the context of the virtual capture of the teacher preparation space by private interests. In this light, how do we view the space, dominated by the “private”, as a space of debate and contestation required for developing critical thinking teachers? (Batra, 2022).

Revisiting teacher agency

Whether cultivating agency can enhance teachers’ professional and self-governing space becomes important in the light of the observation that structure-agency debates remain unresolved; though attempts have been made to synthesize this duality. Sayed and Novelli (2016, p. 18) argue that social systems are a “result of interaction between individuals (agency), who are aware of the ‘rules’ (structure) and are also capable of bringing about structural change by influencing the ‘rules’ that govern social action”. Given that the agency of teachers is related to their positions in society and in the education system, it needs to be examined in the current context of altered “structures” and “cultures” within which teachers work and which generate and shape educational practice.

At this point it would be useful to engage with some of the theoretical ideas around the construct of agency. The notion of “agency” as associated with “free” will and the capitalist notion of “enterprise”, central to the development discourse was rejected by social feminists to argue that agency is related to power and ideology (Wilson, 2008). In Butler’s (1990) view, agency is productive power that involves resistance to authority. Examining the discourse on racism, Baez (2000, p. 329) argues that the agency-structure dichotomy obscures how racism is produced and resisted at local sites of power, such as classrooms. Educators she argues, must engage in resistance-practices to challenge the “normalizing effects of institutional practices and relations” in (re)producing racism. Resistance therefore, needs to be seen in relation to agency of teachers working in an emancipatory framework to bring about change (Sannino, 2010). Barker et al. (2001, p. 46) view agency as “the socially constituted capacity to act”. Scholars have also distinguished between agency as discursively and socially constructed and agency as developing individual subjectivities and identities that are negotiated and constituted within the social (Eteläpelto et al., 2013).

Notwithstanding the structure-agency debates, more recent scholarship has addressed the fundamental question of: why agency? And whether teacher agency can even be achieved and how?

Within a more pragmatic framework, the idea of teacher agency can be linked to discursive shifts in the educational discourse as a consequence of neo-liberal reforms (Biesta, 2015). One such shift, as indicated earlier, is a focus on learning outcomes and evidence-based education. This, argues Biesta, undermines the subjective judgment (of the teacher); and assumes that teachers can and should be told what to do in classrooms. Teacher professional (subjective) judgment he asserts, is essential to the educational process as it is intimately tied to the question of purpose in education. It is therefore crucial that teachers be given the space and opportunity to exercise their professional judgment. Agency, in Biesta’s (2015) view therefore, is a key dimension of professional judgment; and professional judgment he argues, is crucial to achieve two critical functions of teacher education, namely, “socialization” and “subjectification”.

In the above argument, agency can be seen to be rooted in the philosophy of action developed by Dewey and Mead (Biesta, 2005, 2006); establishing the view that the purposes and processes of education are intertwined. Vygotsky’s cultural-historical framework and his emphasis on cultural tools also offer the scope to understand “how human agency plays into how we learn and act upon the world” (Edwards, 2017, p. 269). Agency in this frame is seen as an ecological phenomenon; and not “a capacity residing in individuals” but “the way actors critically shape their responses to problematic situations” (Priestley et al., 2013, p. 9). Agency emerges through the interplay of personal capacities and resources, enabling and constraining contexts, by means of which individuals act. Teachers are key to this process as they reflect and often act counter to societal constraints—sometimes enabled and often constrained by their social and material environments—each time bringing subjective judgment to the task of decision-making.

In theorizing agency as ecological phenomenon Priestley et al. (2015) assert the possibility of achieving “individual agency”. Individual teacher agency is reflected in processes of education comprising of interpretation, meaning-making and pedagogic communication. However, because teachers often work in isolation and in environments of competition rather than collaboration (Long and Lampen, 2014; Batra, 2017b) there are serious constraints in developing the collective agency of teachers. Also, cultivating individual agency does not resolve the structure-agency tangle. For teachers to feel empowered requires not only individual

agency to take professional decisions inside the classroom, but also political agency that comes from an understanding of the many facets that impact education, and a vision for a transformed society.

The concept of teacher agency would therefore entail a gamut of dimensions that equip teachers to act collectively and politically, in order to resist and impact policy and the structures within which they work. The journey of developing teachers may therefore need to include processes that augment “epistemic agency” and reflexivity; equip teachers with professional capacities to take a view; and the disposition and mettle to act collectively and politically.

Critical spaces to achieve teacher agency

In keeping with Biesta’s (2015) theorization, enabling discursive resources for teachers to develop agency through initial teacher education and ongoing professional development is critical and in the realm of possibility. Well-crafted, long duration initial teacher education programmes can enable “self-constitution” as a potent force via opportunities to interrogate teachers’ existing roles, identity and positions in society. Long et al. (2017, p. 17) observe that elements of the 4-year integrated Bachelor of Elementary Education (BEEd) program as envisaged and enacted (Batra, 2009), “where attention is given to the self, to conceptions of knowledge, and to socio-political structures, provide this pre-service teacher education focus”. The BEEd is acknowledged as an exemplar program by the National Council for Teacher Education (NCTE, 2009, p. 49). This initial teacher education offers the critical space where agency can be cultivated via emancipatory experiences that develop epistemic identities, reflexive dispositions, and critical professional repertoires. Examining teacher agency in the implementation of the new Scottish curriculum, Priestley et al. (2013) found evidence of agency within the collaborative and horizontal structures rather than hierarchical ones.

Specific principles and domains of knowledge that govern the structure of initial teacher education that aims to cultivate agency can be broadly categorized as follows: interdisciplinary and transdisciplinary enquiry; dialogical interplay between theory and practice; deconstruction and reconstruction of school knowledge; engagement with constructs of human relations, the self and the individual-social interface; and hands-on experience with creativity, professional capacities and pedagogic communication. Each of these provide wide-ranging entry points to engage with fundamental questions about the nature of knowledge and knowledge claims; nature of learner and learning; notions of selfhood, subjectivity and renegotiating identities - thus reconstructing the discourse and practice of education via critically designed components and pedagogic communication during the program. These enable the two critical functions of teacher education—“socialization” and “subjectification”—that Biesta (2015) proposes are necessary for developing teacher professional judgment.

The ecology of teacher agency hence comprises of a complex process of interaction of a range of dimensions—individual, social, cultural, material and structural. To enable agency via an “embedded process of social engagement” includes the unsettling of the normative discourse; developing the capacity to imagine, assert voice; and engaging with the language of possibility and social justice. Each of these discursive experiences are made possible through a combination of curricular components of the 4-year BEEd program, drawn from the conceptual base of a range of social science disciplines and the pedagogic experiences provided.

The next section of the paper presents a narrative that reveals how personal and professional aspects of a life are intertwined and how these find expression and become the medium of deep engagement during the journey of a developing teacher—leading her to be the person she is. This narrative is one of the several narratives—written by select graduates of the BEEd program—as part of a research study (undertaken by the author during the period 2009–2014), exploring connections between teacher education and social change. The original piece, written in 2009 by a graduate of the batch of 2002 is much longer. An edited and adapted version is presented here to illustrate the impact of the 4-year program. The original form of the narrative, as a coherent text of reflection and reasoning, has been maintained without subjecting it to reductionist analysis. In this form, the powerful impact of the program in providing opportunities and spaces is discernible. In the last section, some of the key processes, winnowed from the narrative, illustrate how these might have contributed in cultivating teacher agency.

A teacher’s personal narrative

I was brought up to become a ‘civilized, cultured girl and a good daughter’; and had internalized the roles ‘expected of a daughter, wife and mother’. During the four years of the programme, notions of the ‘good child’ started breaking, especially as I came face-to-face with myself through a series of self-development workshops and theoretical engagement with identity, caste, gender and social exclusion. I began to understand how my socialisation - at home and outside - and how our positions in society influenced the decisions we took in everyday life.

I started dialoguing with myself. My deep self that constantly sought recognition from others, gradually turned inwards. I felt compelled to question my feelings, limitations and potentials, even my existence. Discovering myself, I began to respect myself; and most importantly, to accept myself for the way I am. As I discovered my strengths, I burst into all sorts of creative expression - writing poetry, acting and the arts. These opportunities lent me a ‘voice’ - to assert and to fight for my rights as a woman and a Dalit.

(The term Dalit was used as a census classification of “Depressed Classes” prior to 1935; after which the term Scheduled Caste was used. The term is rooted in the historical and political struggle of the “Depressed Classes”, a term used by Dr. B.R. Ambedkar (1891–1956), himself a Dalit).

I chose to work on 'women and teaching', as part of my fourth year research project. Reading and discussing through the course on 'gender and schooling' led me to think about my assumptions and beliefs about gender. I began to understand subjective realities of women's oppression from the perspective of my own position in a patriarchal society. I ceased to view myself as a 'victim' of social prejudice.

The above is but an imperceptible peep into how I was to transform as a person. I could think critically but was confused. The world seemed diseased and wretched. I felt as if someone had stolen my tinted glasses that safeguarded/disallowed me from 'seeing' the world as it existed. Small injustices would trigger a chain of reactions, sometimes of awful proportion. I was seen as quarrelsome, a misfit in my family and society. Many felt I had lost my 'feminine charm' - of being compliant, forbearing, submissive and timid. I was often told how unfit I was for marriage. To my disbelief, my parents worried for my sister, as if I would sway her too. Friends outside college told me that 'textbook knowledge' is not about real life.

Today, I am far more resilient. Conflict coming out of constant questioning opened new ways of understanding the world and myself. I learnt that what we consider 'natural', 'inevitable', 'good' or even 'true', may not be so. Conflict forced me to transform myself - intellectually and emotionally. Even as I write, I continue to fight many battles in the everyday - as a woman and Dalit.

For years, I had nurtured the guilt of being a Dalit. I was afraid to reveal my caste identity. The thought of being labelled as belonging to a 'reserved' category' haunted me. I had seen many SC (scheduled caste) and ST (scheduled tribes) school children face blatant exclusion. In self-denial, I started criticizing the reservation policy. I thought people who availed reservation were considered incompetent; and took a vow never to avail benefits of reservation. Soon I felt alienated from my own community.
(As per the Indian Constitution, Scheduled Castes and Scheduled Tribes fall under the "reserved" category for the purpose of granting specific benefits including education and employment.)

Sociological concepts helped me understand my socialization and why the educational discourse is dominated by upper caste, urban and male thinking. In my enthusiasm to explore my milieu and the larger world, I dabbled with any activity that came my way. Learning took a different meaning for me. I celebrated this epistemic shift in all spheres of my life; it was exciting.

Engaging with 'curriculum studies' revealed how the dominant retain social control through education. I understood how teachers are influenced by political, economic and social forces that shape them to become mere carriers of textbook information. Analysing school textbooks revealed how ideology is used as a weapon to dominate.

In our batch students came from different cultures, taste, even dressing style. None of us were keen to become teachers. Differences were pronounced and sharp. Humiliating, criticising each other had become an everyday norm. By the end of the fourth year something changed - we bonded with love, care and concern for each other. The change started happening in the second year of the programme during self-development workshops. Many of my classmates opened up. Those who belittled others with such ease broke down in front of the whole group, reflecting on their childhood experiences. Workshops helped us develop insight into the prejudices we hold about people. Opportunities to reflect and question ourselves helped develop empathy and trust. I could now carry the inner strength gained, with me everywhere.

I came to terms with the fear of failure and isolation. I regained confidence and developed the courage to take risk. Theatre helped to imagine the possible and develop the conviction to alter reality. What I gained in the four years has been emancipatory and enlightening. I have gained the tools to think and explain; the language of critique and possibility; the capacity to imagine and innovate; and most significantly the courage to challenge hegemonies and speak against injustice; the conviction to fight for my rights and the rights of others.

The narrative reveals how opportunities for reflection creates dialog with the inner self—a core engagement of the 4-year program—which when interfaced with theory and the field, appears to have created a "unique chemistry of experiences and processes of engaging with social reality, questioning the self and social milieu, reflecting on one's position in society and developing a sense of agency" (Batra, 2015, p. 169). The narrative uncovers how voice and agency developed through an "embedded process of social engagement". Learning experiences led to a series of processes that disrupted the normative discourse and challenged socialization; developed the capacity to imagine and find voice; and made accessible the language and praxis of possibility and social justice. Each of these processes, discussed in detail below, are authenticated by the narrative, demonstrating how pedagogic experiences and communication can be designed to develop epistemic agency and a sense of social justice that inspires individual and collective action.

Disrupting normative discourse and challenging socialization

Normative discourse is intimately tied to subjective experiences of caste, gender, race, class, religion and community. These are reflected in the socio-cultural preconceptions that play out in everyday life in and outside school. Making a case for perceiving the school as counter-socialization, Kumar (2004, p. 87) argues that “we need to perceive the school in conflict with the community’s code of socialization”. To develop agency, student-teachers are given opportunities and well-crafted experiences to examine prevalent normative discourses using an inter-disciplinary lens; and how these determine social relationships and life trajectories. This facilitates engagement with questions of diversity - how diversities come into being and how stereotypical and discriminatory attitudes that buttress inequality are constructed. Inter-disciplinary engagement offers a framework to deconstruct and reconstruct school knowledge; challenge and verify knowledge claims. Examining the lived experiences of diverse communities enables contesting the perceived neutrality of knowledge, merit and objectivity. Contesting school curriculum, assumptions and cultural beliefs about knowledge and learning offer the opportunity to unsettle habitudes. Interrogating constructs embedded in society engenders new perspectives, enabling teachers to cognize the classroom as an imaginable site of confronting “power that dominates” and “educing power to transform reality”.

The narrative reveals the student-teacher’s struggle as she deconstructs perceptions about her “self” and understands her identity as intimately tied to issues of diversity and social justice. The careful integration of learning experiences creates the potential to challenge the “cultural self”, nudging it to question and aspire to understand the self and the other. The focus on and engagement with subjectivity creates opportunities to reconfigure personal identities. As student-teachers become aware of the social injustices around them, they learn to question and resist the projected image of education as apolitical. Components of the program bring teachers closer to their aspirations and identities, allowing them to grow as communal beings with shared purposes. Diverse pedagogic experiences provide them with conceptual tools that are emancipatory, allowing them to break the shackles of socialization and wrestle their way through structures that encumber agency. Agency is realized through the “socially constituted self”, wherein socialization is “creatively reconfigured in relation to hopes, fears and desires for the future”, substantiating Emirbayer and Mische’s (1998, p. 971) assertion that agency reflects the intent to transform the present.

Developing capacity to imagine and find voice

Theater in the BEEd provides the platform to imagine and create “possibilities” where none exist. It provides a context as well as a medium of learning, enabling epistemic shifts in the notion of pedagogy; and the “democratization of classroom space” (Shivapriya, 2004). In addressing issues deeply personal in nature, theater offers non-threatening spaces to engage with the theory-experience disconnect around gender, caste, identity, exclusion, injustice and the self. Probing the theory-experience dialectic forms the basis on which student-teachers learn to speak the language of possibility.

The de-contextualized psychological frame that forms the dominant sub-culture of teacher preparation is substituted by a deliberative discourse that breaks the false neutrality and “apolitical posture” within which teachers are prepared (Batra, 2014). Engagement with issues and concerns of contemporary society lead to major epistemological shifts in imagining the nation, where constructs of local knowledges, active citizenship, diversity and inclusion, attempt to redefine curriculum and establish teaching as socio-political practice. This prompts the developing teacher to view herself as central to a transformative agenda and not a mere implementer of a given curriculum.

The narrative highlights how teachers can be educated to engage with issues of inequity by being exposed to egalitarian methods of teaching and learning. Finding and asserting voice in the personal space of family and community is perhaps the most significant achievement for a young person preparing to become an educator. Learning to negotiate the familial space of authority and tradition creates a new sense of person-hood and the confidence to walk uncharted paths with courage and conviction. Drawing on Vygotsky’s cultural-historical perspective, it can be argued how student-teachers “push themselves to make sense and to connect their sense-making with the public meanings valued in teaching” (Edwards, 2017, p. 275).

Experiencing the language of possibility and social justice

The narrative demonstrates how traversing through her life journey created the possibility of interfacing the social with the individual. Engaging with the complexities of social reality develops capacities and the need to introspect, reason and call into question hierarchies and inequalities by voicing concern; expressing dissent and reaching out to make a difference. With the breakdown of power equations between the teacher and the taught, prospective teachers experience democratic spaces of learning. Developing notions of pedagogy that are non-hierarchical, fosters the idea that knowledge is not transmitted but actively constructed within the shared context of learning. Epistemic inquiry of social realities prompts critical understanding of concepts that have been taken for granted and cast in limited frames. For instance, questioning the popular notion of poverty as a mere economic indicator, prompts student-teachers to question related assumptions of poverty as an “individual condition” and a “state of mind” that is sought to explain children’s low performance in school. Foregrounding the importance of teachers’ conceptual understanding in

supporting agency, Greene and Yu (cited in MacLellan, 2017, p. 251) argue that taking the responsibility for “what we know and do not know”, “marks our epistemic agency”, “because knowledge arises from the choices we make individually to engage or not engage”.

Another graduate shares how initial teacher education “helped me develop perspectives with respect to various issues, whether they were related to children, society, or education ... teaching methodologies change a lot with one’s perspective with respect to knowledge and learning. As a professional teacher, I am able to appreciate children’s role in learning Various courses made me conscious of the fact that what is taught and how it is taught are deeply political questions. Much refinement came from the practicum, projects, field visits and the internship program” (excerpt from the personal narrative written by a BElEd graduate of 2004).

Examining the individual within the socio-political facilitates envisioning the role of the collective in creating change. Agency comes into being through the “socially constituted self”, emerging out of a focus on personhood and subjectivity that help reconfigure personal identities. In the words of the narrator, whose personal narrative is presented in this paper, “the malaise, conflict was an essential stage of understanding the world before we could undergo crucial shifts in perspective.” Conflict provided the impulse to struggle epistemically and emotionally. Positioning herself as a “catalyst of change”, the narrator substantiates Emibayer and Mische’s (1998) argument that agency is connected to the intended vision of a future different from the present. As Biesta (2015, p. 989) argues, the process of “continual imaginative reconstruction of the future involves drawing upon past experiences in order to clarify motives, goals, and intentions, to locate possible future constraints and to identify morally and practically appropriate courses of action.” Addressing teachers’ aspirations along with their identities as epistemic and social beings foregrounds the need, as argued by Belo (cited in Biesta, 2015), to critically examine their own assumptions, values, and beliefs.

Conclusion

This paper has argued that the operational linkage between a socially inclusive and humane education pivots around the teacher and teacher collectives. Several trans-national examples bear testimony to the socialist feminists’ assertion that agency is located at the collective as well as the individual level (Wilson, 2008). Analysis of educational reforms in Porto Alegre in Brazil highlights how democratic educational policies and practices have been sustained with the active participation of reflexive teachers (Gandin, 2011). Examples of teacher collectives offering resistance as in the Chicago teachers’ strike (Lipman, 2013) demonstrate the possibility and potential of collective teacher agency. Long et al. argue how teachers’ unions in South Africa successfully resisted administering the ANAs (Annual National Assessments) in 2015, because they “strongly believe that the ANA in its current form, is not in the best interest of our learners (and) the provision of quality education” (2017, p. 8).

Developing the agency of teachers requires deep engagement with structural reforms, and the disruption of teaching as “self-normalizing practice”. While the former prepares teachers for collective political action, the latter helps teachers recognize their own complicity and positioning in the conditions they contest. The personal narrative unveils that “the problem of teacher agency considers how power, identity, subjectivity and freedom intersect and inform each other” (Pignatelli, 1993, p. 412). Engaging teachers with complex dynamics between the self, the other, episteme and power is at the heart of the proposed shift in the narrative of educating teachers.

Human beings are not born once and for all on the day their mothers gave birth to them, but life obliges them over and over again to give birth to themselves.

Gabriel Garcia Marquez, “Love in the Time of Cholera” (2007).

Introduction and focus

The COVID-19 pandemic has forced educational leaders, researchers and policy makers worldwide to “give [new] birth to themselves” in the move to remote teaching and learning. The transition has been sharp, unexpected and created uncertainty and pressure (Reich et al., 2020), as well as new opportunities for educational leaders and systems to redefine themselves in this contested reality. Taken to the field of mentoring in teacher education (the focus of this article) we are witnessing a concerted effort to reinvent and redefine mentors’ roles and practices as agents of change and mediators of teacher learning in this new medium (Mutton, 2020; Floden et al., 2020). Metaphorically, it has led to the pressing need to “prepare mentors in the time of Cholera”, as the title of this article suggests, inspired by Gabriel Garcia Marquez’ best seller “Love in the Time of Cholera” (Garcia Márquez, 2007).

“Wisdom comes to us when it can no longer do any good”, Garcia Marquez writes. Indeed, his words resonate with a panelist’s comment participating in a recent virtual conference around the challenges of policy, research and practice ahead of us in teacher education: “Corona has motivated us to think outside the box in terms of how we can re-invent ourselves to access each other’s worlds in new ways. We have to become relevant to the on-going, day-to-day changes in the education arena, which, of course, directly influence the education of teachers’ [personal communication]. Addressing this call, this article discusses the perspectives, challenges and promises of mentoring in the new digital teacher learning space. Specifically, it focuses on recent research agendas and policy trends aimed at redefining and “reinventing” the preparation of mentors in diverse socio-cultural educational contexts across the globe. I then zoom in to the case of mentoring in Israeli teacher education. The socio-cultural and political complexity of such a context can serve as a rich illustrative case of how new conceptualization and operationalization of mentoring is dialectically constituted at the intersection between local settings of centralized politically-driven educational policy and the diverse and contested socio-cultural/ethnic contexts of teaching and teacher education within which such policy operates (Biesta et al., 2020; Nir, 2020). Within this background, I present two recent studies on mentoring in teacher education launched in Israel in response to the COVID-19 pandemic. These studies exemplify the challenges and concerted efforts to create new connections between research, policy and practice in order to inform on the preparation of mentors and teacher educators for supporting teacher learning in highly diverse and disputed socio-cultural educational contexts in the new digital/hybrid space.

The first part discusses global perspectives based on recently published research and conceptualization around the question: What characterizes the passage from synchronous to asynchronous/hybrid mentoring in terms of mentors’ roles, tasks, practices and interactions? The second part deepens into two recently launched local studies in the context of pre-service and in-service mentoring in Israel, with a focus on diverse teaching populations. This is followed by a discussion of the challenges that emerge from recent study initiatives for the conceptualization and preparation of mentors for diversity. Finally, I discuss the promises and potential opportunities afforded by an era of almost full digitalization in teacher education and mentoring.

Perspectives: from face to face to remote mentoring

Mentoring in teacher education, whether face-to-face, remote or hybrid, is essentially about the mediation of teacher professional learning. Resorting to their knowledge and expertise as experienced teachers, mentors constantly engage in mediating between persons and content in value-laden contexts of practice (Feiman-Nemser, 2001a,b; Orland-Barak, 2010; Clarke and Mena, 2020). Prior to pondering into studies that focus on the new teacher learning space of remote mentoring, let us consolidate what we know about face-to-face mentoring and the mediation of teacher learning.

The study of face-to-face mentoring

The study of face-to-face mentoring can be consolidated through several comprehensive reviews conducted on global perspectives on mentoring research over twenty years [1991–2014], (Wang and Odell, 2002; Orland-Barak, 2014, 2016). The reviews surface major shifts from technical, strategic, monological approaches to mentoring (predominant in the early 80s) to dialogical, socio-cultural, discursive views of mediation in mentoring and mentored learning (from the early 90s onwards) (Harrison et al., 2006; Roehrig et al., 2008; Richter et al., 2013; Orland-Barak, 2014; Orland-Barak and Wang, 2020). The latter view, still prevalent at the sprouts of the 21st century, emphasizes aspects of mediation related to mentors’ reasoning, competencies and skills (Feiman-Nemser, 2001a,b; Achinstein and Athanases, 2006) and/or contextual aspects of mentoring relationships related to cultural, ideological and identity aspects of mediation interactions (Zeichner, 2012, 2020). To this end, mentoring mediation is conceptualized as entrenched in multicultural realities, at the intersection between mentors and mentees’ values, belief systems and behaviors throughout the pre-service, induction, and in-service teacher life-long learning continuum.

The major conceptual shifts in the study of mentoring can be represented as moving from a focus on mentoring as transmitting knowledge to mentoring as mediating knowledge (Orland-Barak and Maskit, 2011), as illustrated in Fig. 1 below:

Recent studies on mentoring also stress the importance of integrating modeling and the acquisition of core practices with contextual aspects of mentoring (Forzani, 2014; Grossman, 2018; Kavanagh et al., 2020; Kavanagh and Danielson, 2020). This growing and often debatable trend (Philip et al., 2019), claims for the need to promote systematic reasoning through strategic mediation, geared at the acquisition of patterns and repertoires of practice that can be appropriated to the particularities of the context. Taken together, then, the mediation of teacher professional learning through mentoring is broadly conceptualized nowadays as a practice characterized by interconnectedness between cognitive, behavioral and socio-cultural factors and between forms of reasoning, prior knowledge and engagement in experiences, and patterns of best practice in activity (Hobson et al., 2009; Mena et al., 2017; Villegas and Lucas, 2002; Fenwick and Edwards, 2010). Such conceptualization extends Homer’s Mentor matriarchal and patriarchal functions of caring, support and guidance to include dynamic, collaborative and interactional mediating roles that develop within multifaceted networks of interactions in activity and in a variety of contexts (Edwards, 2017) as illustrated in Fig. 2 below:

In their article “Five waves of conceptualizing knowledge and learning for our future in a networked society” (2019), Hoadley and Kali contend that if we consider how technology has changed the relationship between individuals, learning, and society, one finds that technologies are creating the space for a fifth wave of technology mediated learning. Can we also think of mentoring, as the mediation of professional learning, as being redefined in this new wave? If so, how? To address this question, let us first consider recently published research on mentoring in the context of the new digital teacher learning space, which has developed worldwide during COVID-19.

Mentoring in the new digital teacher learning space

In his editorial for the Special Issue entitled Teacher education and COVID-19: Responses and opportunities for new pedagogical initiatives (Mutton, 2020), Trevor Mutton stresses “the fascinating way in which so many teacher educators internationally have seen the current crisis as an opportunity to consider new ways of working, to adopt innovative approaches to pedagogy and to re-conceptualize the nature of their teacher education programs” (p. 439). Indeed, the issue opens a pioneer window into a wealth of questions, challenges, pressing issues and innovative pedagogies that teacher educators are grappling with around the world. In

Fig. 1 Conceptual shifts in the study of mentoring.

Fig. 2 Cognitive, behavioral and socio-cultural dimensions of mentoring roles.

the context of mentoring for teacher preparation, the various studies in the special issue as well as in other important recent publications, consider issues related to mentors' new roles and skills (Carrillo and Flores, 2020; Sepulveda-Escobar and Morrison, 2020; Hadar et al., 2020a,b), pedagogies and methodologies of mediation that are technologically enhanced (Philipsen et al., 2019; Locke, 2020; Mutton, 2020; Loose and Ryan, 2020; Hadar et al., 2020a); issues of equity and values that emerge in the digital learning space (Darling-Hammond and Hylar, 2020) and forms of adaptive expertise to the new teaching-learning environment, often positioning expert mentors as novices (Thompson et al., 2020; Donitsa-Schmidt and Ramot, 2020). These publications, indeed, take up Darling-Hammond et al.'s (2020) call to update and strengthen teaching and school leadership standards that reflect new emergent knowledge about social, emotional, and cognitive development; culturally responsive pedagogies; and trauma-informed practices. For example, Scull et al.'s study in Australia (Scull et al., 2020) suggests supporting teachers in the move to on-line teaching and learning through innovative pedagogies and indicators to develop and evaluate newly identified dimensions of access, participation and engagement. Robinson and Rusznyak's study (Robinson and Rusznyak's, 2020) in the South African context, consider other aspects of learning such as situational learning, relational learning and pedagogic reasoning that need to be redefined when mediating learning from and in practice in the new digital school-based experiences. Thompson et al. (2020), focus on how the abrupt move to remote teaching has disrupted traditional novice-expert mentoring relationships positioning mentors (as I have previously argued "sometimes as novices and sometimes as experts" in their reasoning and actions (Orland-Barak and Yinon, 2005). They describe situations in which the novice was in a position where s/he was more knowledgeable than the mentor, mostly as related to technical aspects of on-line teaching such as setting up zoom meetings, collecting school-work in virtual classrooms, or creating pre-recorded content for asynchronous instruction. As they contend, these new novice-expert positionings during mentoring interactions challenge traditional apprenticeship models whereby the mentor teacher functions as an expert and model to the novice teachers. I would further argue that it invites a fresh "restart" for redefining traditional apprenticeship top-down mentoring roles and mentored learning models, which are still strongly dominant in numerous teacher education programs. The need for such rethinking is strongly voiced in Leacock and Warrican's paper (2020), in the context of teacher education in the West Indies. They urge moving away from what they refer to as traditional colonial-based perspectives on teaching and teacher learning, in order to meet the new constructivist and digitally enhanced character of teaching and teacher support.

The above studies leave us with challenging questions for future thinking and research. For example, Barnes and Sax (2020) raise questions of whether traditional school-based assessment by mentors are appropriate for teacher certification given the new conditions, as well as questions of technological affordances such as online teaching simulation for assessing teacher competences. Thompson et al. (2020) wonder whether the uncertainty and vastly changed work context for which a high percentage of mentors are unprepared will require programs to screen mentors for a new set of skills and to revisit effective mentoring needs in a COVID-19 teaching context. Hadar et al.'s study on student teachers' social-emotional competencies during the COVID-19 crisis (2020), raises important questions such as how to enhance teachers' social-emotional competencies, how to redesign a teacher education curriculum that would balance between subject matter and pedagogical content knowledge and knowledge about coping resources, in order to strengthen students' emotional agency. In this vein, they suggest a possible additional direction in professional development programs, which focuses on new roles for mentors as agents of change through the dissemination of mindfulness practices to develop teachers' social-emotional competencies. Elaborating on new roles and pedagogies for mentors, Assunção Flores and Gago's study in the context of Portuguese teacher education (2020), highlights the need to prepare school mentors to mediate student teacher learning in areas that they identify as problematic in the digital teaching-learning space. Some of these are connecting between theory and practice, justifying pedagogical decisions, carrying out the observation-planning-evaluation cycle, conducting formative assessment and managing new conditions for learning to teach as related to time, space, forms of interaction with pupils and mentoring processes. In a parallel literature review co-authored by one of the same two authors, Carrillo and Assunção

Flores (2020) extend these aspects to difficulties related with poor online teaching infrastructure; inexperience in the use of digital instructional formats (quoting Huber and Helm, 2020) of both teachers and mentors (quoting Judd et al., 2020); limited information and resources, and the complex environment at home (quoting Zhang et al., 2020). These emergent problems, they contend, touch upon issues of agency, responsibility, flexibility, choice and student presence. They also foreground worrying issues of equity and inclusion, reinforced in Huber and Helm’s comparative study of German, Swiss and Austrian schooling evaluation, assessment and accountability in times of crises COVID-19 (Huber and Helm, 2020). One of their conclusions highlights the urgency of attending to student/teacher populations coming from socially weak families or educationally deprived families, those with low self-regulating abilities, and those who face difficulties in planning their day. School communities as networked systems, they contend, should collaborate to compensate for the socioeconomic disadvantages of students’ families, particularly in disadvantaged areas. They call on fostering coherent approaches with collegial support and networks with other partners within education and in the local and regional contexts. In the US context, the call to prepare teachers to work with families and communities in teacher education has been strongly and critically voiced by Ken Zeichner (2019, 2020), Cochran-Smith and Villegas (2016), and many others for the past three decades. Within these calls, Zeichner’s recent article “Preparing teachers as Democratic Professionals (2020) goes further to caution us about the dangers of trying to “save” students from their communities (Zeichner, 2019; Dzur, 2008), rather than preparing them for working with and for their students’ families and communities (Haddix, 2015; Murrell, 2001, quoted in Zeichner, 2020).

At the background of these concerns and challenges, Hill’s study (Hill et al., 2020) from British Columbia proposes interpreting these as opportunities for re-envisioning the preparation and support of teachers in managing equity and social justice, wellbeing and environmental protection in the new digital teacher learning environment. Likewise, Donitsa-Schmidt and Ramot’s study in the context of teacher education in Israel during the COVID-19 pandemic, stresses the “bright side” of the need to develop emergency remote teacher education platforms. Their study identified the emergence of numerous bottom-up professional learning communities that were initiated by the teachers themselves in collaboration with teacher colleges. Their findings highlight enhanced collegiality, solidarity and collaboration, which was built around trust and respect among the community members. This led to the development of safe and supportive environments for deepening understandings and trying new practices. Thus, they contend, paradoxically, the period of social distancing and self-quarantine led to increased peer collaboration, shared learning, mutual aid and growing partnership between academic institutions and training schools (p. 586–595). Similarly, Sepulveda and Escobars’ study on on-line teaching placement during the COVID-19 in the Chilean context suggests that, despite the impasses identified mainly in terms of lack of communication with supportive agents and mentors, which ultimately affected the quality of feedback student teachers received, participants, mentioned positive aspects of the experience and work with mentors and teacher educators. Specifically, they agreed that the experience enhanced their teacher preparation in terms of learning to adapt to unexpected situations, to learn how to work with different technological platforms and to design strategies for reaching their students in the virtual mode. Also taking a promising stance, Philipsen et al. (2019) combine goals, processes, strategies, context and outcomes to propose an integrative framework for teacher professional development for on line and blended learning through regular and just-in-time support and feedback.

The above said, Shelley’s aphorism “the rich get richer and the poor get poorer” (Shelley, 1845) resonates in my ears, especially when thinking about socio-cultural contexts where on-line affordances are scarce and often almost non-existent, as evidenced in some of the local contexts that are described in the next section.

Remote mentoring in diverse contexts: lessons from two local case studies

The following two local cases illustrate recent research initiatives in Israel to collect comprehensive evidence of how mentoring for teacher learning operates in the new learning digital space both in pre-service and in-service education. Case One is situated in the contested socio-cultural and economic context of pre-service teaching practice in Arab schools. Case Two demonstrates concerted efforts to create new collaborations between Ministry policy and local teacher education research to provide evidence-based foundations for developing remote mentoring and professional development in diverse school teaching settings.

Mentoring student teachers in “the time of cholera” in public arab schools: impeding and facilitating socio-cultural, economic and organizational conditions of the context

There is a growing acknowledgment that mentoring in a context of cultural diversity should address the voices and cultural practices of the various national and minority groups that are part of a society (Mullen, 2020; Mayer et al., 2017; Orland-Barak, 2010). Despite this, many teacher education and mentoring models worldwide still forward a rather uniform approach to learning to teach, taking little account of the diverse cultural, social and national affiliations and traditions that student teachers bring to teacher education from their home background (Cochran-Smith and Villegas, 2016). Israel is no different (Eilam, 2003). Despite the diverse social, religious and political tapestry of its society (Agbaria, 2016), Israeli teacher education institutions follow, for the most, a centralized uniform curricular policy. The new COVID-19 reality of social distancing has stressed the problem of uniformity even more acutely, given the unique features of the context that characterize mentoring and mentored learning in the Arab society, especially in Arab public schools in Israel (where student teachers do their practice teaching assisted by mentors). The Arab minority in Israel (including Muslims, Christians and Druze) form around 21.0% of the total population in Israel and around 55% live in a lower socioeconomic status than that of the Jewish population (Central Bureau of Statistics Israel, 2020). The Arab and Jewish

education systems in Israel are separate, and for the most part the two societies maintain a different way of life and culture (Arar, 2012). Despite positive developments that the Arab education system in Israel has undergone in recent years, it still faces challenges and barriers (Arar and Abu-Asbah, 2013; Arar and Massry-Herzllah, 2016). Many schools are characterized by low achievement levels, high dropout rates, inadequate budgets and resources, and low teaching quality with traditional norms and teaching methods in schools (Arar and Haj-Yehia, 2016). In addition, these schools are less technologically oriented, have limited access to technology and lack experience in virtual teaching skills (Arab Education Monitoring Committee, 2020). These constraints create unique challenges for pedagogical mentors working with these student teachers, and especially now, during the COVID-19 pandemic. At the background of this context, we launched a comprehensive two-phase research study (Daniel-Saad and Orland-Barak, *in progress*) aimed at exploring the pedagogical and personal experiences of around 200 pedagogical mentors from the Arab society in Israel working with student teachers in school practice teaching settings where in-person mentoring has changed almost fully into remote mentoring through a-synchronic (Moodle/mail and WhatsApp application) and synchronic mentoring (Zoom platform/Unicko). We combine various theories and models: Hofstede’s cultural dimensions theory (Hofstede, 1991, 2001) with Schwartz’ theory of basic values (2009) as complementary frameworks to examine how culture and values shape patterns of perception and processes of knowledge building as well as particular attributions to events and evaluations of behavior. We also examine these patterns in relation to different approaches to mentoring as conceptualized in Orland-Barak and Wang’s integrative mentoring model (2020), and to mentors’ adaptation to the new virtual, social and supportive organizational environments in terms of skills and dispositions through Moho’s model of human occupation (Kielhofner, 2009). The research questions revolved around mentors’ significant hardships and crisis events, successes and coping strategies, to gain access into their professional experiences in the passage from face to face to remote mentoring. We asked: What characterizes mentors’ transition experience in the Arab society to remote mentoring during the Corona crisis? How do pedagogical mentors perceive the crisis in their work as related to their beliefs, and approaches to mentoring? How do cultural characteristics shape mentors’ coping strategies in the virtual teacher learning space? How does the new virtual mentoring environment influence mentors’ functioning? How does the organizational environment operate as an enhancing/hindering condition for sustaining the passage? The research interview guide included questions about the following topics:

- Mentoring models and professional experiences: personal principles and values that helped manage emergent challenges.
- Mentoring roles and the practicum in an online environment: perceptions of role; ethical issues raised regarding remote mentoring (privacy, information security, developers’ copyrights); resources that mentors find as being most helpful in managing this period.
- Mentoring roles in the Arab Society in an online environment: environmental conditions that helped to adapt to the new emergency mentoring reality; inhibiting conditions; school possibilities for online work.
- Outcomes in the application of remote mentoring experiences: difficulties and challenges through accounts of particular events; strategies used to deal with the situation.
- Implications as to what is expected to happen.

The first phase of the study which was qualitative and has now been completed, gathered thick data from on-line semi-structured in-depth interviews with twenty selected Arab mentors, representing eleven major teacher education colleges and universities throughout the country (Tel Aviv, Haifa, Central, North Juda and Samaria and Jerusalem district) in different types of schools (regular and special education). Emergent findings from the data support recent studies described in earlier sections in regard to mentors being compelled to reinvent their roles, skills and practices “in action”, given the fact that they had no previous guiding models or knowledge to lean on. We also identified the blurring of formal traditional boundaries between mentors with their student teachers (where interactions used to take place in the stable school environment and had now moved to students’ homes, family cars or other areas outside the school). For example, mentors were bound to observe their student teachers teach in their homes (both for student teachers and pupils) and with their family members present. The blurring of boundaries was also felt in the move to an almost full time week work (although mentors’ work contracts were not extended) in which “matriarchal” mentor roles (which were less stressed before) were intensified: sustaining continued mentoring relationships, providing on-going emotional support, and assisting students to manage personal, familiar conflicts that emerged. To this end, mentors mentioned having to deal with challenges related to the particular collectivist and patriarchal features of the culture. For example, since mentoring meetings were conducted via zoom in the student teachers’ homes, there was a tendency to adopt norms of communication and interactions that were accepted by their family members. This often led to a more reserved and inhibiting discourse, avoiding confrontation or exposure of sensitive aspects that both student teachers and/or mentors might have wanted to raise. Some students coming from orthodox families also resisted the use of cameras, or appearing in video, which they reported as limiting the sharing of ideas and exchange of knowledge. Technologically, there were also reported challenges faced as related to lack of resources, and inadequate Internet connectivity. The socio-economic factor has also played a negative role in facilitating the online learning experience. One example is a case reported when a parent called to complain about the use of the camera during the lesson, since their house consisted of two rooms only, thus obliging the student’s mother to have her head cover on during the whole lesson since wherever she moved, she could be seen on the camera. Patriarchal orientations to education were also described. One example is the case in which the fiancé decided for the student teacher whether she would participate in a peer learning session or not, or cases of parents interfering with the college emergency instructions at times of lockdown. The dual role of the female student teacher, wife and mother obliged her to maneuver between the contradicting requirements of the family roles and those of the academic institution. This had consequences for the quality of their participation in mentoring sessions. All of these factors

constituted an additional challenging layer that hindered the passage to remote mentoring. Based on the findings from this phase, the third phase (2021) will entail the design of a questionnaire that will be distributed to 400 Arab mentors across the country. By the end of the project (December 2022) we hope to obtain a comprehensive evidence-based picture of what mentoring “looks like” and “feels like” for the Arab population of mentors working in Arab State schools.

Research-policy connections “in the time of cholera”: spheres of knowledge for mentoring in the digital teaching space

The demanding challenges of moving to online teacher learning prompted the Office of the Chief Scientist at the Ministry of Education in Israel to promote an initiative that brought together educational researchers and academics from universities and teacher colleges in order to provide support to the educational system in dealing with pressing areas related to remote learning and teaching. One of these focal areas was mentoring and teacher professional development for remote teaching in diverse contexts of practice. The committee for this area formulated five theoretical/evidence-based principles for teacher learning in the new digital environment: the need to cultivate technological skills in particular disciplinary contents (Mishra and Koehler, 2006); the need to cultivate technological and technological pedagogical teaching approaches with a focus on how these can address differences between student populations and contexts, while striving for equal opportunities for learning and assessment (Avime et al., 2020); the importance of attending to prospective and experienced teachers’ ingrained beliefs regarding the integration of technology in teaching and how these mis/align with principles of online learning (Blonder et al., 2013); the importance of including awareness of and tools for dealing with social, emotional and identity aspects of teaching and learning online (Garrison et al., 2001) and the need to create an integrative hybrid mentoring model that combines different approaches to teacher mentoring in terms of orientations to knowledge construction and development, content, context, experience and change processes, and that is sensitive to teachers’ developmental stages (Orland-Barak and Wang, 2020). At the background of this document, which was published and disseminated to the entire population of teacher educators, mentors and stakeholders involved in teacher education in the country, we launched a pilot study, which was funded by the Ministry of Education to investigate how these principles play out in the context of online practice teaching (Blonder and Orland-Barak, 2020). We assumed that the digital learning space has different characteristics from the physical space of the school (for example, distributed knowledge and cognition, activities that combine online interactions in a hybrid way with classroom teaching methods (hybrid learning) and involvement in new knowledge-building interactions that might raise issues of equity (Hoadley and Kali, 2019). We contended that these knowledge fields may challenge and expand traditional models of teacher knowledge defined generically (Shulman, 1986; Gess-Newsome, 2015) and disciplinarily (e.g. in EFL-Pang, 2016 and science teaching, Driets-Esser et al., 2017). We were curious to understand what happens in the encounter between theoretical knowledge about digital learning and the experiential knowledge that develops within the online practice school teaching setting. We aimed at gaining an initial glimpse at how mentor teachers in diverse settings deal with unplanned situations that arise in the online space, to encourage social interactions, to conduct discussions during a lesson, to conduct laboratory experiments in the online space, to identify evidence for learning in the online space, to develop online assessment, etc. A follow-up, large scale mixed-method study (in progress) is intended to gather additional data from multiple sources, toward the development of a theoretical and operative model of practice teaching in the digital environment, based on the bodies of experiential knowledge identified.

The initial study identified spheres of expert teacher knowledge (some of which reinforce recent studies described in previous section) that operate in the digital teaching practice space and have direct implications for mentoring roles and forms of assistance to address these spheres in diverse contexts (Singer, Doryoseph, Blonder, Orland-Barak, in progress).

- Reinventing teacher identity: This sphere of knowledge includes how a teacher identifies herself, her philosophy of teaching, her style and the many factors, which influence this perception of self, which may be transferred, transformed and/or disrupted in the digital space. This sphere connotes with previously described studies about how the shift to teaching in a digital space positioned experts as novices.
- Tracking Pupil Engagement: The teachers we interviewed each described their sense of tracking engagement in the face-to-face classroom and lacking it in the digital space, which ultimately created a reality of isolation for the students (Hargreaves and Fullan, 2020). Our expert teachers gave examples of seeking and finding ways to “feel” the class. The knowledge to be fostered in this area includes pedagogical awareness of the need to track student engagement, understanding of what constitutes evidence of engagement, and technological tools to enact activities, which provide evidence of engaging pupils.
- Assessing pupil knowledge: The sphere of knowledge for assessment includes identifying and tracking the development of pupil knowledge (Inbar-Lourie and Levi, 2020). In addition, it includes measures of the effectiveness of teaching methods through digital formative and summative assessment. It seems that this sphere of knowledge has room for new methods, suitable tools of testing and a new approach to testing.
- Identifying activity effectiveness: This category focuses on measuring the effectiveness of assessment methods in the digital space. The opportunities for outside help, even as simple as spellcheck, open the need for alternative methods of assessment. These new activities must be measured for effectiveness.
- Personalizing Communication: The direct face-to-face informal communication at school, in the hallway, before or after a lesson, when teachers watch the breaks, and during lessons, is absent in the digital space. Participants reported that during digital lessons they communicate in small windows of sixteen students at a time. In fact, when the students do not have a camera or have not turned it on, they only have a box with a name and maybe a voice, and there is a need to express personalized messages. So, this sphere of knowledge was found to be especially important. The knowledge needed in this sphere includes awareness of the importance of informal communication between teachers and students, understanding of the significance of

establishing personal connection between teachers and students in this new environment and designing activities which enable personalized communication through relevant technical tools for facilitating communication.

- Providing emotional support: Adapting known expressions of caring to the digital space was seen as very complex, and knowledge of how to provide emotional support was perceived as critical. The need for acquiring digital means of providing emotional support was strongly voiced in expressions such as “We can’t see them!”, conveying teachers’ frustration of the lack of resources for providing emotional support.
- Retooling content: This sphere of knowledge goes beyond knowing the subject matter being taught—it includes awareness of how the content can be adapted to fit in the digital space.
- Implementing technology-based pedagogy: The affordances of technology such as artificial intelligence, assistive technology, randomization, etc. were seen as a central aspects of new knowledge that needs to be developed. These also touch upon another complementary sphere identified, which was teaching students to become independent learners by maximizing the potential of the digital space.

How can the above initial identified spheres of expert teacher knowledge along with recent findings from local and global studies described in previous sections, inform on new directions for thinking about the practice of mentoring “in the time of cholera” and beyond? This is the focus of the following section.

Challenges: conceptual, curricular and practical directions to mentoring in the digital teacher learning space

Conceptual directions

In previous sections I posed the question of how/whether mentoring should be redefined in light of what [Hoadly and Kali \(2019\)](#) refer to as the fifth wave of technology mediated learning. The above synthesis of recently published and in progress research on mentoring, implies considering an additional layer of mediation to our understanding of mentored teacher learning. Conceptually, this new layer is grounded in the acknowledgment that the new digital teacher learning space grows out of socio-cultural views of teacher learning in the digital environment, including new norms and rituals of social interaction, of social and cognitive presence, new dimensions of equity, and of participation in the co-construction of knowledge in the digital space. Such a view invites ways of thinking about mentoring as operating in contexts of distributed cognition and knowledge in blended activity (i.e., across individuals, artifacts and tools which combine online educational materials and opportunities for interaction with traditional place-based classroom methods). The new layer of mediation necessitates preparing mentors to support teachers in using the features of the new digital context to redefine known pedagogical content and practical knowledge around aspects of organization and selection of content, classroom management (such as time, focus, voice, silence, participation, issues of equity, visibility, presence and language) while analyzing teaching situations and engaging in problem-solving mentoring interactions. It also invites a form of mentoring that combines distance learning conducted in a virtual learning environment with electronic study content designed for self-paced (asynchronous) or live web-conferencing (synchronous) online teaching, mentoring and tutoring. Furthermore, knowledge construction in community in hybrid learning spaces becomes, more than ever, central to teacher support and development. Finally (and most importantly), “context matters” ([Becher and Orland-Barak, 2018](#); [Van Den Berg, 2020](#)). This implies, as findings suggest, that mentoring in the new digital space should consider forms of mediation that are sensitive to the fact that experienced teachers are often positioned as novices (and vice-versa), and to the unique conditions of differing teaching contexts (i.e., socio-cultural, economic, political, physical, organizational) which can either promote or hinder the successful passage from face to face to remote teaching and mentoring.

Curricular directions: integrating mentoring approaches in remote mediation

The above conceptual directions push us to further refine recent conceptions of an integrated approach to mentoring ([Orland-Barak and Wang, 2020](#)), in order to attend to the unique features of the digital teacher learning space identified in recent research. The proposed refined model (illustrated in [Fig. 3](#) below) suggests connecting between the new identified areas of teacher learning and knowledge that need to be addressed in remote mentoring, and the kind of mentoring roles and approaches that can best facilitate the mediation of teacher learning in pre and in-service education in those areas: (1) Strategic and situated approaches to mentoring that stress mentor roles as models, as expert teachers and as co-thinkers can promote student teacher learning in the following areas of teacher learning identified in recent research: identifying activity effectiveness; personalizing communication; retooling content; evaluating participation; engagement and access; redefining the lesson cycle; tracking pupil engagement; assessing pupil knowledge; accessing technological affordances at the workplace; managing time and space; adapting to unexpected situations; working with different technological platforms; designing strategies for reaching students in the virtual mode. (2) Critical approaches whereby the mentor functions as critical pedagogue and agent of change to promote teacher awareness and agency can attend to the following areas of teacher learning (both novices and experienced) identified in recent research: Managing issues of ethics, equity and responsibility in the digital teaching space; attending to deprived socio-cultural-economic contexts with limited information, resources and access to technological platforms; questioning new practices in terms of the educational values promoted (3) Personal growth approaches in which the mentor assumes dialogical mentoring roles to promote teacher development (with a stress on in-service education) can facilitate in the following areas of growth identified in recent studies: being a novice again; reinventing teacher roles and identity; developing social-emotional competencies; developing adaptive expertise; promoting culturally-responsive teaching in the new digital

Fig. 3 Integrated mentoring approaches in remote mediation of teacher learning.

space; building on strengths to manage the new and unknown. Different mentoring roles, then, capitalize on the strengths of different approaches for developing particular areas of teacher learning in the digital space at different professional development stages. In any one mentoring interaction, these can operate in an integrative manner, combining diagnostic (i.e., mapping teachers' strengths, challenges and areas of learning to teach that need to be improved); deliberative (i.e., flexibly integrating relevant mentoring strategies in action) and inquiry (i.e., examining mentoring processes and outcomes) mentoring skills and competencies to support teacher learning (Orland-Barak and Wang, 2020). These integrative mentoring roles and practices require preparing mentors for thinking and performing adaptively, and for moving flexibly across different remote mentoring contexts. It also requires preparing them for managing tensions between teachers' needs, lacks and wants in the new digital teacher learning space, mentors' own tendencies to preserve familiar modes of practices, and professional demands on teacher learning.

Promises: new channels of communication between mentoring research, policy and practice

I conclude this article by discussing the promises of mentoring in the digital space, with a focus on new connections that have recently been established between the research-policy-practice discourse. It is widely recognized that the global and local discourses

of educational policy and research seldom engage in deep dialogue to improve the practice of teacher education (Biesta, 2007). Mentoring, as integral to teacher education processes, seems to suffer from a similar disconnection (Huber and Helm, 2020). True, the connection between research, policy and practice has always presented a challenge due to the different languages used, the different time frameworks in which they operate and the different principles that guide them. No doubt, each actor within this triangle is fully aware of the potential realization that these connections withhold for the field of education. However, the base for this relationship, which lies on a common ground of the perception of fidelity and truth creating trust, is not stable (Nelson et al., 2009). Research does not seem to be informing policy the way it should, and many would contend that policy changes usually occur detached from research agendas (Sleeter, 2014). It is also true that misalignments might be because research questions do not really attend to the interests and questions of potential users but rather solely to those of academic researchers (Levin, 2013).

The Israeli case is no different, especially given its political context, which is subject to constant instability and frequent changes of power. Within this context, we must mention the power of the two teacher organizations who are, in many cases, an obstacle to changes and improvements. Together, this environment has a drastic effect on the educational field as far as its priorities and ability to implement long-term changes are concerned. As a result, policy makers are forced into a tight schedule that does not enable them the leeway to perform research or even review up-to-date research to guide them in policy setting. Subsequently, like other aspects of educational policy, teacher professional development policy is subject to changes in the political sphere and to different emphases throughout the years. Turning to research, and although researchers aspire their work to have an impact on educational policy and practice, educational research in Israel values conceptualization and theoretical breakthrough, leaving much interpretation to overloaded and overwhelmed policy makers and practitioners. A well-known dispute between policy makers and researchers in conference panels in Israel is best illustrated in this excerpt (from one of these panels):

Policy maker: “I need answers to pressing problems of education “yesterday” but we only get them from you “late tomorrow” ... and then, when we get them, a couple of years later after the study is completed, we have already moved into something else”

Researcher: “And my biggest frustration is that you jump too fast from one reform to another and do not stop to build on gathered evidence in order to refine and improve initiatives that you started” [personal communication].

Recently, though, the above discourse seems to have undergone some welcome shifts. The new COVID-19 pandemic has created the need to open new channels of communication between the two discourses (Biesta et al., 2020) in order to successfully “survive” the challenges described in earlier sections. Thus, the common discourse of divide in Israel was compelled to move toward a more reconciling one, as policy makers and researchers joined forces in order to provide practical evidence-based solutions to the unprecedented and pressing reality of the COVID-19 uncertainty (see also Donitsa-Schmidt and Ramot’s study (2020) referenced in earlier section). This is evident in two major calls recently disseminated by the Ministry of Education (September and November 2020). Notice the opening paragraph of one of these calls (translated from Hebrew):

For many years we have witnessed the importance of establishing relevant connections between educational policy and research in order to improve educational practice. Despite this, we are constantly being engaged in dialogues that stress the disconnections between the three ... The Corona period has intensified the need to join forces and create better connections between the different participants in the educational arena. This has recently led to opening new fruitful communication channels between them. Following this emergent trend of collaboration, we invite you to submit research proposals that are geared to strengthening links between research, policy and practice in the following areas of education

Chief Scientist-Ministry of Education (November 2020).

In fact, one of the above local studies presented in this article is being financially supported by one of these calls. Connecting to Young et al.’s (2002) competing models of research and policy relations, COVID-19 has eventually prompted the shift in teacher education and mentoring research in Israel from a conception of educational research as being mostly guided by knowledge and enlightenment models of research (not necessarily committed to informing immediate policy concerns) toward more problem-solving and interactive models informed by policy issues, as well as by views of research and policy as being mutually influential. This has yielded recent agendas for both research and policy decision that are created within policy communities across a range of actors and within the entire spectrum of central policy, the laboratory and research teams.

Coda: back to the future

Amidst the above emergent shifts, it will be interesting to follow future research on mentoring to gain a deeper understanding of whether these winds of change are stable or fluctuating (especially post pandemics). Will research and policy go back to their divided roots or will they grow in new, entrenched directions? This invites following future research on mentoring with an eye on questions such as: What kind of questions and purposes guide future studies? What barriers and challenges of educational policy are taken into account? How are findings connected and/or suggested to be translated to practice? How do they connect to burning policy issues? These questions will help us understand future trends in mentoring in terms of the relations they exhibit between knowledge production and knowledge capacity (Levin, 2013) both in pre and in service education. For example, if a research question is prompted by a problem-solving model, how does it develop in the various stages of analysis, interpretation and representation of the focal study? How do the implications connect between findings and policy recommendations?

Back to the future, I return to Garcia Marquez’ novel ending:

He looked through the windows at the complete circle of the quadrant on the mariner’s compass, the clear horizon, the December sky, without a single cloud, the waters that could be navigated forever, and he said: “Let us keep going, going, going, back to La Dorada” ... “and how long do you think we can keep this goddamn coming and going?” ... “Forever, he said”.

(Garcia Marquez, 2007, p. 348).

Introduction

The deployment of comparative approaches in the study of education now has a considerable history, stretching back to the 19th century. However, from the early days when the main task of comparative education was to describe national systems of education and to identify similarities and differences between them (e.g., King, 1967), we can now see a much greater range of perspectives within the field. We see for example much greater attention being given to the significance of “context” (Crossley and Watson, 2003; Phillips and Schweisfurth, 2008), we see greater understanding of “policy processes” (Bowe et al., 1992), and of the effects of “globalization” (Rizvi and Lingard, 2010). We can also see how comparative studies do not have to be undertaken only at the level of the national, or “macro,” we can also undertake comparative approaches to understanding policy and practice as realized at the institutional (meso) or indeed personal (micro) level. In other words, comparative studies may be undertaken at macro, meso and micro levels, each of which can reveal important insights (Tatto et al., 2018a,b).

In this chapter, while we fully acknowledge the pervasive influences in contemporary teacher education of “neoliberalism” and “performativity,” our purpose is to demonstrate the enormous potential benefits in taking comparative approaches. The argument developed in the chapter is that it is not only the research community that gains from comparative study, but that teachers themselves may enrich and enhance their own working lives and professional identities through connecting with such comparative investigations (Tatto, 2021). At a time when the impact of climate change is becoming more widely recognized as a threat to the very existence of life on this planet and a time when a global pandemic has reminded us how vulnerable every human being is, we also see many instances of increasing national populism (Eatwell and Goodwin, 2018) and “nativism,” as well as an escalation of associated phenomena including physical conflict and transnational migration.

In the sections that follow we move from considering the respective influences of economic factors, through to politics and then to ecology and health. In each of these we emphasize the importance of taking an historical approach to our comparative analysis. Thus, in the next section we explore the developing impacts of globalization on teacher education in more detail, seeking to show how these impacts are manifested in different experiences at different levels and how in any particular contexts they are influenced by the history and culture of that setting (Alexander, 2000). We then turn to consider the growth of nationalism and populism and how they have had an influence on policies and practices of teacher education, again in different ways and at various levels. Following that, we consider the relatively recently identified threat of climate change, how it is leading to a resetting of priorities in teacher education, a process which may have been accelerated by the occurrence of the COVID-19 pandemic, which commenced in early 2020. We move toward a conclusion by seeking to identify some “resources of hope” (Williams, 1989), which may offer positive ways forward, enabling teacher education to play a role in ensuring global stability, sustainability, peace and democracy in the future.

Market models and performativity in teacher education: the impact of globalization

The introduction of market models in education aided by globalization has had negative yet predictable consequences for the field of education and teacher education. The notion of predictability is important here as it underlines the purposeful character of these reforms.

The definition of the market model applied to education and its effects are well known. In the US for instance according to an insightful analysis by [Tucker \(2012\)](#), analysts' arguments were constructed as a direct attack against public education which they represented as a "government monopoly where teachers and administrators lacked incentives to control costs or deliver quality." He argues that following market models, the proposed reform would reallocate the public funds raised for the schools into the hands of parents by promoting school choice. The notion of school choice meant that in theory parents would be able to choose the best schools for their children as measured by higher achievement scores in international, national and local tests, with the idea that levels of achievement would rise and costs would go down. These proposals were rejected initially but continuing arguments by analysts and the increasing costs of education accompanied by the unwillingness of politicians to raise taxes to support schools created a strong rationale to engage in a market reform of the education system with the strong support from the U.S. Department of Education. The reform was backed by systems of rewards and punishments, the latter being school closures as a result of students' low achievement and poor teacher evaluations.

Diane [Ravitch \(2016\)](#), a US historian, has written extensively about the negative consequences of this turn to the market which includes privatization, the rise of charter schools, parental choice, and a trend toward performativity marked by increased standardization, testing, and teacher evaluations. These reforms have given rise to attacks against public schools, the teaching profession and teacher education. Contrary to what the reforms promised we have seen an increased lack of equitable access to quality education for disadvantaged students, a dramatic drop in the number of teachers entering the profession and an increase in the number of teachers leaving their posts. This has accelerated as a result of the COVID pandemic.

The market model, performativity and implications for education and teacher education

The turn to the market in education began in some countries such as England in the 1980s and in the US around the 1990s. Since that time evidence confirms the limited effect of this reform in achieving its alleged aim to improve equitable access to quality of education for the school-going population or an increase in learning as measured by achievement tests ([Waslander et al., 2010](#)). Market theory tells us that "market systems allow individuals to exchange goods and services voluntarily based on prices, without knowing one another" ([Kling, 2021](#)). This is the first of many problems with applying the model to education. The model goes against the culture of schooling. As anyone who has had a child in school or anyone who has taught or administered in schools knows, schools are intrinsically relational places. Children and their families get to know each other quite well, and the parent grapevine is quite effective in nominating the best teachers as per common perception (only rarely are decisions based on results of teacher evaluations). Most of the resulting decisions happen locally which (somewhat paradoxically) dramatically reduces the opportunities for choice. Another key problem of the theory is that education markets are characterized by the relative inelasticity of demand and supply. As [Waslander et al. \(2010:65\)](#) point out after examining several education systems across countries, "for markets to function efficiently, buyers need to respond to changes in the price/quality relation (elasticity of demand), and sellers need to respond to customer demand by either diminishing or extending production (elasticity of supply)" in other words parents are typically satisfied with local schools, and schools have difficulty "growing easily when increasing numbers of parents and pupils wish to attend," in other words, physical space may be limited, it is difficult to expand quickly or schools simply chose not to change/expand.

While international evidence shows that market reforms have been a failure in accomplishing their alleged intended objectives ([Waslander et al., 2010](#)), they have had dire consequences for the educational systems, notably in altering the way people relate to each other. According to [Fiske, 2004](#), as cited in [Kling, 2021](#)), an anthropologist who studies aspects of sociality across cultures, there are four basic models through which people interact, these help us understand how market reforms have altered relationships in educational systems. These models are: Communal Sharing (where the idea is to share such things as resources and responsibilities among the members of a group); Authority Ranking (where people have asymmetric positions in a linear hierarchy, such as administrators to teachers and teachers to students); Equality Matching (where people keep track of the balance or difference among participants and know what would be required to restore balance such as turn-taking); and Market Pricing (where relationships are oriented to socially meaningful ratios such as wages, or cost-benefit analyses). According to Fiske in this last model, money need not be the medium, and relationships need not be selfish, competitive, maximizing, or materialistic. All these four relational models can be found in schools but the turn to the market has served to destabilize these delicate relationships which indeed require a basic element that has been eroded in the process, namely trust in schools ([Bryk and Schneider, 2004](#)). Communal sharing where teachers collaborate with teachers, administrators and parents in developing school policies and curriculum standards and in supporting student learning has given way to regulatory mechanisms, where standards, curriculum and testing come from outside the schools and places teachers in the position of compliance lest they risk low achievement scores for their pupils. The capacity for Equality Matching among participants has been lost, as people (teachers, the school community) under the pressures of accountability and performativity, have lost the capacity to keep track of the balance or difference among participants and now lack the tools or the resources (such as time) that would have allowed them to restore balance. Under the Market Pricing model, the ideal that relationships need not be selfish, competitive, maximizing, or materialistic, has also been transformed by the introduction of parent

choice, testing, and teacher evaluations and the system of rewards and punishments in schools via inspections and accountability (Cochran-Smith et al., 2018; Tatto, 2007).

The turn to the market has also affected the university project of teacher education (Furlong, 2013). In the mid-1980s, in both England and the US, alternative routes to teacher certification emerged under the rationale that diversification would be a way to supply more teachers to schools and also as a response to growing criticism of university-based teacher education. These routes have been growing steadily in the US as well as in England and the quality of their graduates vary widely. Nevertheless, these routes have been legitimized and strongly supported by the U.S. Department of Education (U.S. Department of Education, Office of Innovation and Improvement, 2004), and England's Department for Education (DfE). In the US these programs have proliferated with the major initiatives being Teach For America, Academy for Urban School Leadership, New Teacher Project, American Board for Certification of Teacher Excellence (ABCTE), New York City Teaching Fellows, Mississippi Teacher Corps, and Educators of Change. Likewise, in England in addition to the university-led graduate teacher training program, known as the Post Graduate Certificate in Education (PGCE), other programs are School Direct (tuition fee or salaried), school-centered initial teacher training partnership (SCITTs), the Postgraduate Teaching Apprenticeship, the Teach First Leadership Development Program and Assessment Only, among others. Comparisons between those attending university-based teacher education and alternative programs show mixed results (Matsko et al., 2021; Sass, 2015; Stoddart and Floden, 1995; Brown, 2018; Sorensen, 2019).

Marketization and performativity are not universally adopted

While the market model has been adopted and defended by governments in several countries despite existing evidence that it does not work and is damaging for schools, teachers and students, other countries have been able to avoid partially or fully such a trend. Notably in Finland, Sahlberg (2012) has denounced the global education reform movement (GERM) because it has increased rather than reduced global inequality and has undermined the teaching profession. Japan has also avoided such trends from affecting its education system (LeTendre and Ikoma, 2019). Other authors have carefully documented the effects of these reforms and how the purposes of the reforms are misaligned with the purposes of education (values, human rights, democracy), and with the values and motives of teachers (Childs and Menter, 2013; Tatto et al., 2018).

When examining countries that have not adopted the market model in education and are ahead in educational outcomes, several features are noticeable, such as investing in children's wellbeing and early childhood education. Investment in teachers emerges as an important priority as well. Not only are teacher preparation programs more selective in enrolling high ability graduates from high school, but teachers are also prepared to master the subjects they are going to teach and pedagogy to teach them, teacher pay is higher, and teachers are specifically prepared to teach the required courses for their students (Darling-Hammond, 2017; Tucker, 2012). Other elements include a strong local or national curriculum and international level standards, and less testing.

Summary

The turn-to-the market in education has failed in creating a better, more equitable and resilient system. In the US investment in charter schools and school choice was the wrong type of investment (Berliner, 2020), it has benefitted the business interests of those that founded these schools at the expense of public schools (Tucker, 2012), and it has decimated the teaching profession. The emphasis on performativity through standards and teacher evaluation has not been less damaging. The results are as could be expected, teachers are leaving the profession and many who would have become teachers are not entering the profession. As of this writing schools in the US are lacking in teachers with the state of Florida, for instance, announcing nearly 5000 teacher vacancies, the situation is similar in other states including Arizona where one-quarter of teaching positions are vacant (Heyward, 2021; Khmara, 2020). The major impact of this reform is on the children of disadvantaged populations. The COVID pandemic has revealed with more clarity how much the education sector has been devastated by these reforms.

National populism: its influence on teacher education

Globalization and market-based reforms are not the only important movements that are affecting education and teacher education. The rise of national populism, another deliberate and purposeful movement, is an important and possibly permanent drive that has acquired much force in the last few years (exemplified by the rise of Trump in the US, and Johnson in Britain), marked by social movements in the US culminating with the march to the Capitol Building on January 6th 2021 (also called an insurrection led by Trump) in attempts to delegitimize and stop a cleanly elected president Biden from taking office). Across the Atlantic, the triumph of Brexit in Britain effectively separated the four UK nations from the European Union (EU). Populist parties in the EU are increasingly occupying parliamentary seats, most notably in Hungary and Poland. On the other side of the world in Brazil, a national populist candidate was elected president in 2018. The rise of far-right groups all over the world is another outcome of these populist movements. The concern with these movements is that they may turn into authoritarian governments—as indeed was shown by the actions of Presidents Trump (US) and Bolsonaro (Brazil) who, during the COVID pandemic, have contributed by their actions to the death of many by their lack of belief in science, which resulted in misinformation and lack of vaccinations for many citizens, a situation which is still true in Brazil at the time of writing (Pereira, 2020).

In their book, *National Populism: The Revolt Against Liberal Democracy*, Eatwell and Goodwin (2018) suggest that as much as the election of Trump and the passing of Brexit surprised many, it would be wrong to define national populism by these events alone. Rather they argue that national populism can be seen as a democratic movement that decries Western liberal hegemony with its emphasis on individual rights (rather than communal obligations and solidarity), ethnic change, economic and political globalization. To them national populism is

driven by a deeper desire [by the people who feel unempowered] to bring a broader set of values back onto the agenda and regain their voice; to reassert the primacy of the nation over distant and unaccountable international organizations; to reassert cherished and rooted national identities over rootless and diffused transnational ones; to reassert the importance of stability and conformity over the never-ending and disruptive instability that flows from globalization and ethnic change, and to reassert the will of the people over those of elitist liberal democrats who appear increasingly detached from the life experiences and outlooks of the average citizen.

Eatwell and Goodwin (2018: xxxii).

They argue that the movements we are witnessing could be the “beginning of an era of political fragmentation volatility and disruption” accelerated by a breakage of the “bonds between the people and the traditional parties [...] and unprecedented ethnic change and rising inequality.”

The same authors, Eatwell and Goodwin (2018: xxi ff.), direct us to four long-term trends or “historic shifts” that have fed into the increasing development of national populism and that are not always grounded on objective reality:

- *distrust* of politicians and institutions fueled by the perceived elitist nature of liberal democracy and lack of voice in the national conversation;
- *destruction* of the national group’s historic identity and established ways of life fueled by perceived threats caused by increased immigration and “hyper” ethnic change;
- *deprivation* or a sense of “relative” deprivation fueled by the perceived notion that certain groups are losing out relative to others as a result of globalization and market-based reforms, and rising inequalities of income and wealth in the West, which is also associated with a loss of faith in a better future;
- *de-alignment* or the weakening bonds between the traditional mainstream parties and the people, which makes political parties across the West more volatile, fragmented and unpredictable.

The authors argue that these trends need to be analyzed together as national populist leaders feed on these trends and have been able to persuade an increasing number of people to follow their lead, many toward authoritarian populism.

Education and the nation-state

A key question that emerges in the West as we witness these rapid changes and increased instability of historic forms of education is the role of the state in education and particularly in teacher education. Traditionally education systems were controlled by the state because, in great part, education was seen as indispensable for the development of healthy democracies. An important argument that supported the key role of education in the US came from Dewey (1916) who argued for the need to provide access to quality education for all citizens (universal public education) to support the advancement of the individual and society. His ideas as well as those of other philosophers and sociologists of education were disseminated widely and influenced the underlying philosophy of education for many years not only in the US but globally, and provided the rationale for the state to take most of the responsibility for such an important task.

As discussed above, the introduction to market models and the global influences on education gave rise to decentralization and privatization where intentionally the state devolved its responsibility for education to the regional departments of education or the private sector. Green (1997: 2–5) refers to this trend as the “post-national” era and wonders “how far can national states control education systems, in a world of global markets, supranational political organization [and] pressures for international convergence”? The case of England operating under market models illustrates how the actions of an authoritarian state is managing to destroy years of progress in the education sector using misleading arguments.

At this point, it would be important to once again turn to a comparative exploration and analyze developments in the East Asian countries and Central and Eastern Europe and their process of democratization where, as Green argues, the state tends to continue to see education as playing a central role in constructing a sense of national identity, language and culture. It may well be that in the West and after the COVID pandemic, education will be seen as a renewed priority and that the education and proper remuneration of teachers will be seen as essential in the development of modern citizens who, in Green’s words “would have a broader understanding of the interdependence of nations, the diversity of societies, and the global nature of solutions to the world’s problems” (Green, 1997).

Influence on teacher education

While globalization, marketization, and performativity have served to de-professionalize teaching, national populism has served to minimize the importance of the knowledge that teachers acquire in university-based programs. Many in the national populism

movement, including Johnson and Trump, have publicly attacked theory and science with serious consequences for the school curriculum and the teacher education curriculum. Currently, in England and the US, many individuals are entering teaching without the knowledge and skills needed for the job. The market reforms and the re-definition of what counts as a qualified teacher as well as the re-definition of the teacher role as performing to external standards guided by market-oriented purposes of education have discouraged many from entering the profession. Racism and discrimination which has been fueled by the national populist beliefs that increased during the Johnson and Trump administrations have prevented many students from entering the profession.

Appealing to populist ideas and “evidence” to dismantle the profession

In 2010 in England, a White Paper, *The Importance of Teaching* (DfE, 2010), produced under the leadership of Michael Gove, the then Secretary of State for Education, introduced a “revolutionary reform,” using as a justification England’s lower scores in the OECD PISA test on literacy and mathematics and a faulty analogy between teacher preparation and medical preparation, devolved the responsibility for teacher preparation to the schools which he saw as equivalent to hospitals! When doctors become interns and then residents in hospitals they are already *doctors* (they have a credential—a medical degree) and have undergone many years of study in schools of medicine in higher education institutions (in the US, four years, including rotations in different hospitals). Nevertheless, the English White Paper encouraged the ‘best schools’ to become independent, that is to convert to “academy” schools (the equivalent to charter schools in the US) and to group into supra-organizations called Multi Academy Trusts (MATs). This was meant to free schools and school personnel in order to “innovate and concentrate in education,” albeit under more strict regulations or accountability systems led by the Ofsted inspections regime.

Moving forward to 2021 also in England, the “Initial Teacher Training ITT Market Review Report” (Department for Education, 2021), reinforces and expands such reform by recommending a “new set of quality requirements to be implemented by all Initial Teacher Training providers of courses (programs) that lead to QTS [Qualified Teacher Status] and a robust accreditation process [...] to meet the exacting quality requirements in full upon accreditation and on a continuing basis” (p. 4). The review led by CEOs of various school trusts and directors of programs such as Teach First and one former curriculum research and design individual, recommended a re-design of the ITT curriculum, the identification of placement schools with trained mentors, a detailed assessment framework, a quality assurance requirement for accreditation, and partnerships (e.g., between HEI and SCITTs). The claim is that these recommendations are “fully aligned with the career-long, evidence-based professional development offer for all teachers” (p. 5). The introduction to the report only mentions higher education institutions in association with the SCITT and end by remarking the importance of “existing strong SCITTs and School Direct Lead Schools becoming part of the reshaped market.”

Responses from educationists

These sweeping reforms continue to be implemented without solid evidence of success despite the frequent mention of “evidence” in both reports. Helgetun and Menter (2020) analyzed how “evidence” is used in both of the above documents and urged educationists and analysts to carefully examine the nature of such evidence and question whether such evidence warrants the ever-evolving policies affecting teaching and teacher education. In other words, this evidence does not come from the systematic empirical evaluation of these reforms but from disparate pieces of work put together to advocate the reformers’ position.

The vulnerability of teacher education and the teaching profession more generally is not in most cases due to the quality of the provision but rather to the natural variability of the field. A recent comparative book examined the nature of professional knowledge in 12 countries, seeking to answer the larger question of how conceptions of knowledge across the countries shape teacher education and the knowledge and skills of teachers (Tatto and Menter, 2019). The review found that such knowledge is quite varied and while each system has the same purpose (to prepare high-quality teachers) the field as a whole is fragmented concerning the pedagogy and the actual knowledge teachers must possess. While this fragmentation is natural given the way teacher education programs must respond to cultures within and across settings, this fragmentation has allowed the market to intervene in many of these countries.
